

Although the MINEHOUND is significantly more expensive to purchase than standard MD, the improved productivity and reduction in labor required for clearing highly contaminated minefields should cover the cost of the initial investment within one to two years. In the future, overall cost per square meter should be reduced in areas with high signal densities compared to using standard MD alone. ©

The authors would like to acknowledge the support of the following organizations for their contribution:

- U.K. Department for International Development for initial proving trials carried out in Angola, Bosnia and Cambodia in 2005 and 2006.
- U.S. Army's HD R&D Program for supporting trials in Afghanistan and Cambodia.
- The directors of Cobham Technical Services and Gerhard Vallon of Vallon GmbH for their support of the dual sensor technology.
- HALO deminers for gathering the data.

See endnotes page 51

Dr. Jürgen Braunstein was sales director for Vallon GmbH from 2005 to mid 2014. Braunstein earned his doctorate in 1993 at RWTH Aachen University (Germany) on high-frequency devices and circuits, and was part of the faculty of electrical engineering. Braunstein is no longer with Vallon GmbH but can be reached at [jb.biz@web.de](mailto:jb.biz@web.de).
