NPA’s Survey and Clearance of Cluster Munitions Along the Thailand-Cambodia Border

The February conflict at the Thailand-Cambodia border over disputed territory has left Cambodia with the burden of clearing cluster munitions. By applying to the Thai-Cambodian conflict strategies for cluster munitions removal that were successful in other post-conflict areas, NPA is assisting the Cambodian Mine Action Centre in cleaning up the problem. Thailand and Cambodia have not acceded to the ban on cluster munitions established in the 2008 Convention on Cluster Munitions and are therefore not subject to its provisions. Both countries attended the CCM 2011 intersessional meeting in June, leaving many hopeful that the two countries will become States Parties.

by Atle Karlsen | Norwegian People’s Aid |

Thai and Cambodian troops exchanged fire 4–7 February 2011 over disputed territory along the border near the Preah Vihear temple in northern Cambodia, a UNESCO World Heritage site. On 10 February, the Cambodian Mine Action Centre reported it had evidence that Thai forces fired cluster munitions into areas in Preah Vihear province.

Funded by the Norwegian Ministry of Foreign Affairs, Norwegian People’s Aid began a new survey project in Cambodia in 2011 to establish the extent of the cluster-munition remnants problem across the country using methodologies developed through NPA’s work in Laos, Lebanon, Serbia and Vietnam. CMAC asked NPA to conduct an emergency survey of the affected areas. Simultaneously, in Thailand, in cooperation with the Thailand Mine Action Center, NPA conducted a survey of the sites on the Thai border that were attacked with Cambodian artillery during the February conflict.

Neither Thailand nor Cambodia has acceded to the Convention on Cluster Munitions, but positive statements by both nations during the CCM’s first intersessional meetings offered hope that they would join the CCM soon. Follow-up meetings in Cambodia and Thailand in mid-August 2011 included military-to-military dialogue on the obligations of the CCM and alternative, more cost-efficient ways to destroy cluster-munition stockpiles.

Assessment of the Situation

On 1 and 2 April 2011, a delegation from NPA, CMAC and the Landmine and Cluster Munition Monitor visited Cambodia’s affected areas. The objectives of the assessment were to confirm cluster-munition use in Preah Vihear province (number of sites contaminated/types of munitions used) and to assess the impact of cluster-munition contamination on the population.

In Sen Chey village the assessment team found that cluster munitions had hit several houses and people were living among the unexploded submunitions. The assessment team recorded the locations of all unexploded munitions found, and evidence from cluster-munition strikes was gathered (spacers/ribbons, fragments, etc.). It was confirmed that Thailand delivered the cluster munitions by artillery, namely the 155mm NR 269. The assessment also determined that unexploded M42/M46 contaminated the area.

Although some mine-clearance procedures are also suitable for submunition survey and clearance, it is important that more efficient procedures specifically tailored to cluster-munitions identification and removal, including establishing the submunitions footprint, are used when possible. See endnotes page 82

...
CMAC identified 12 cluster-bomb-unit strike sites, and the initial priority recommended by the assessment team was to conduct a rapid but systematic survey of the contaminated areas. While the land has yet to be cleared, CMAC has used the NPA survey to restrict the contaminated area and conduct mine-risk education for the local people. No accidents have occurred since.

**Deployment of NPA/CMAC Teams**

Upon agreeing to assist CMAC, NPA contracted a technical advisor to supervise the training and deployment of survey teams and one explosive-ordnance-disposal team to Preah Vihear province.

The teams conducted appropriate training on IAC operational procedures, provided instruction on technical aspects of cluster munitions in particular, and deployed to the area 1 May 2011. The teams were deployed to three high-priority areas and between 1 May and 13 June 2011 cleared the following areas:

1. Sen Chey village: 115,500 square meters (29 acres)
2. Thomcheat resettlement village: 305,000 sq. m. (75 acres)
3. Area 911: 497,601 sq. m. (123 acres)

The total area the NPA/CMAC teams cleared was 920,101 sq. m. (227 acres). The methodology of the clearance operations was based on the NPA standard operating procedures from Lebanon, and the teams used the Minelab F3 metal detector for all visual instrument-aided surface searches. The performance of the teams was excellent, as observed from the productivity figures. NPA transferred procedures, provided instruction on technical aspects of cluster munitions in particular, and deployed to the area 1 May 2011. The clearance of the remaining contaminated areas in Preah Vihear was continued from 1 July 2011 by other CMAC clearance-capacity resources.

**Lessons Learned**

The clearance of cluster-munition remnants is potentially more efficient than in the case with, for example, landmines, as more and often better quality data is available up front (bombing data coordinates, numbers and types of ordnance used). The Cluster Munition Coalition called on Thailand to release data on target coordinates and numbers and types of cluster munitions used since this could have greatly assisted the survey.

Finally, in many affected countries, a thorough survey establishes the location of cluster-munition remnants, contributes to a greater understanding and real estimation of the contamination problem; and determines where cluster-munition remnants are not a threat. Further, a quality survey allows people in unaffected areas to continue with their lives in safety, and prevents the wasteful use of scarce clearance resources in unaffected areas.

See endnotes page 82

Atle Karlsen is the Country Director for Norwegian People’s Aid in Southern Africa, based in Mozambique. Since 2009, Karlsen has worked as Policy Advisor to NPA, representing NPA in the International Campaign to Ban Landmines and the CCM. Karlsen holds a bachelor’s degree in development economics from the University of East Anglia, U.K. and another bachelor’s degree in international management from the BI Norwegian School of Business Management, Oslo, Norway. He is a member of the editorial board of the Landmine and Cluster Munition Monitor, and has worked on strategy, results management and quality assurance for NPA for the last 10 years.
