I cannot express enough thanks and appreciation to my committee chair Dr. Jeremy Akers for his endless support of and dedication to my research. Without his guidance, determination, knowledge, and encouragement, this extensive study would not have been possible.

I would also like to thank my committee members, Dr. Janet Gloeckner and Dr. Melissa Rittenhouse for their guidance and advice.

In addition, I would like to thank Dr. Paula Maxwell for graciously providing funding for the study to include twenty participants. Analyses of many of the metabolic variables included in this study would not have been possible without it.
Abstract

Consuming a diet similar to our hunter-gatherer ancestors has been shown to confer numerous health benefits. Our purpose was to compare metabolic, physiological, and psychological improvements of participants consuming a full-scale Paleolithic-type diet (PD) or a modified Paleolithic-type diet (MPD). Twenty participants (WT 74.9±3.3kg; BMI 26±1kg/m²) aged 43±3 yrs were enrolled in a two-group, clinical 5-week dietary intervention study comparing a PD to a MPD. All participants were instructed to maintain current activity levels and turn in weekly diet compliance records. Both groups were instructed to consume only items that are included in a traditional Paleolithic-type diet (i.e. lean meats, f/v, eggs, nuts, and fish); however MPD participants were allowed to include three ‘unrestricted meals’ and two ‘unrestricted snacks’. Outcome measures included insulin sensitivity, body composition and weight, blood pressure, and lipid profiles. Five-week data showed a significant within group decline in WT (-3.3±0.4kg), BMI (-1.2±0.2kg/m²), FFM (-0.9±0.3kg), Fat Mass (-2.2±0.3kg), and % Body Fat (-1.6±0.4%) over time, all p<0.05. Clinically, all biochemical and blood pressure measures improved, however there were no significant between group differences. Both groups had 70% retention. Following both a full-scale or modified Paleolithic-type diet for 5-weeks resulted in significant reductions in body weight, fat mass, and percent body fat and may be beneficial for lowering blood pressure, and improving insulin sensitivity and lipid profiles. The present research suggests that following a modified Paleolithic-type diet can have similar physiological benefits as the more restrictive full-scale Paleolithic-type diet. More research needs to be conducted to examine the extent of these benefits.
Introduction

Dietary habits of Western civilizations have been questioned for decades; it wasn’t until recently that contemporary scientists and nutrition experts turned to our ancestors for answers. Evolutionary research indicates that the human genome has remained relatively unchanged since the end of the Paleolithic era some 10,000 years ago; however, dietary patterns reflect quite the opposite [1-3]. Application of this reasoning to current dietary practice is the foundation on which modern Paleolithic-type diets have developed, suggesting a more suitable diet is one that resembles the composition and macronutrient distribution of the diets hunter-gatherer societies from that time period relied on [1-3]. These societies were relatively free of the diseases of affluence currently plaguing western civilization (obesity, coronary heart disease, hypertension, diabetes, stroke, and certain types of cancer) [2-5]. Pre-agricultural revolution Paleolithic diets were composed mainly of lean meats, vegetables, fruits, eggs, and nuts [6]. Modern interpretation of the Paleolithic diet, often referred to as the ‘Paleo diet’, emphasize those same principles and also includes complete avoidance of the cereals, dairy, sugars, refined carbohydrates, and processed foods commonly found in Western diets [7].

The only research studies to date experimentally testing the Paleolithic-type diet have determined many metabolic and physiologic improvements, such as higher insulin sensitivity, lower blood pressure, decreased weight, decreased BMI, and reductions in total cholesterol, LDL, and triglyceride levels, as well as highlighted its satiating effect and improvement of risk factors associated with development of CVD, type II diabetes mellitus, and metabolic syndrome [8-14]. However, these studies were less than three months with no more than 30 participants, showing lack of evidence following long-term sustainability of a Paleolithic-type diet. Furthermore, participants involved in two studies comparing satiety and glucose tolerance of Mediterranean and Paleolithic-type diets, were excluded due to ‘non-willingness to continue’. All excluded participants had been randomly assigned to a group instructed to follow a Paleolithic diet for 12 weeks [8,9].
A study involving a short-term, three-week diet intervention excluded one of its 20 eligible participants due to the subject’s inability to fulfill the diet [10]. These findings are consistent with other low-carbohydrate diet studies in which significant limitations include low adherence, poor compliance, and higher attrition rates in comparison to low-fat diets. [15-17]. The highly-restricting aspect of a Paleolithic-type diet, with regard to both carbohydrate restriction and limited food choices, allows for further speculation of the long-term sustainability of a full-scale Paleolithic-type diet, since normal food habits of participants in these elimination-type diets tend to reestablish once they find the restrictions too hard to abide by [15]. Although the beneficial effects of a Paleolithic-type diet have been demonstrated, the degree of restriction of such a diet may prove to be too extreme for long-term maintenance.

Paleo forerunner Dr. Loren Cordain has also seen this as problematic, and addressed the issue in his book *The Paleo Diet*. Dr. Cordain includes three levels of the diet; level one being a full-scale Paleolithic-type diet with no modification and level three being the version with the most modification, allowing 15% of weekly meals to be ‘open meals’. Open meals are opportunities to indulge on favorite foods, excluding bingeing, so that those foods do not have to be given up permanently, which allows for flexibility of a Paleolithic-type diet [7]. For long-term maintenance of this health-promoting diet, a modified version may be a more plausible option and paleo experts claim this modification can still yield significant health benefits similar to a full-scale Paleolithic-type diet. However, to the knowledge of the researchers, no studies have been conducted to support this theory. The purpose of the present study was to measure the health benefits of a five-week modified- Paleolithic-type diet intervention.
Methods

Healthy nonobese men and women ages 20-64 were recruited via James Madison University’s employee bulk e-mail service. The e-mail discussed the study investigators’ intention to compare two similar diet regimens high in lean meats, fish, nuts, eggs, seeds, fruits, and vegetables, with little to no grain products, dairy, and processed foods. Those interested in participating were emailed an initial screening questionnaire. Completed questionnaires were then screened by the study investigators. Eligibility requirements were healthy, sedentary, age (20-64), BMI between 20-29.9 kg/m², free from chronic disease and ability to follow strict dietary protocols and study requirements. Exclusion criteria were BMI ≥30 kg/m² or < 20 kg/m², special diet requirements, ≥ 10 pound weight gain or loss over the previous year, currently “dieting”, and/or presence of chronic disease (i.e. hypertension, diabetes (insulin and noninsulin dependent), and hypercholesterolemia).

Study design

The study was a five-week randomized dietary intervention study. Eligible participants were given an orientation day, on which details regarding the pre- and post-testing methods, risks of tests, and study requirements were discussed and informed consent forms (Appendix A) were signed and health history questionnaires were completed (Appendix B). Participants were given three blank food intake records (Appendix C), and were provided detailed instructions on how to fill out their usual dietary intake for two consecutive weekdays and one weekend day prior to their scheduled pre-testing session.

Participants were randomly assigned to one of two groups: full-scale Paleolithic-type diet (PD) or Modified Paleolithic-type diet (MPD). PD participants were instructed to follow a diet high in lean meats, vegetables, fruits, eggs, fish, and nuts, and free of any processed foods, grains, cereals, legumes, dairy, and refined sugars. MPD participants were instructed to follow the same diet as the PD group; however, they were allowed three ‘open meals’ and two ‘open snacks’ of their choosing per week on Wednesday through
Saturday. Open meals meant that a typical paleo meal could be replaced with a meal of their choice. Participants were allowed to choose how many items of the meal they wish to replace with non-paleo food items. Since the goal of having open meals is to provide more flexibility and less restriction in a Paleolithic-type diet, participants were allowed to include any food items in their open meals. However, it was suggested that they avoid binge eating or over consuming high fat/sugar energy dense foods. All open meals/snacks had to be documented on ‘open meal intake records’ (Appendix D), regardless of whether or not the open meal/snack was consumed on one of the four food intake record days. Each participant was provided with a detailed binder including their assigned dietary intervention requirements and guidelines (Appendices E and F), allowed foods (Appendix G), foods to avoid (Appendix H), cooking substitutes and essentials (Appendices I and J), where to buy uncommon items (Appendix K), sample two-week meal plan (Appendix L), and recipes (Appendix P).

Both groups were allowed to eat ad libitum. Participants were instructed to follow usual activity throughout the duration of the study. During the five weeks of the intervention phase, participants recorded consecutive four-day food intake records (Appendix M) beginning on the Wednesday of each week. Participants were also asked to complete an adherence chart (Appendix N) each week, on which they were to place a check mark on each meal and snack(s) they consumed that followed the diet regimen or place an X if it did not. Prior to beginning the intervention phase, participants in the PD group were notified that if more than five meals throughout the intervention phase did not follow the diet regimen (as was checked on the adherence chart) they would be excluded from the study. Participants in the MPD group were notified that if more than five meals, not including open meals, did not follow the diet regimen, they would be excluded. Participants e-mailed food intake records and adherence charts to the principal investigator at the end of each week. The principal investigator examined each food intake record and adherence chart weekly to check participant compliance with their assigned diet regimen. Any non-allowed food items that appeared
in the food intake records were addressed, and the participant was notified not to consume that particular item.

Measurements were obtained at baseline and after five weeks of intervention. Participants were asked to fast for at least 8 hours prior to coming for their pre- and post-testing sessions. Pre-testing sessions were 2.5 hours long each, and took place from September 27th to October 12th in the Human Performance Lab located in room 052 of Burruss Hall at James Madison University. Each pre-testing session followed the same protocol: First, a fasting blood sample was taken for lipid profile and fasting blood glucose measurements. The blood sample was collected via fingerstick. The subject’s finger was wiped with an alcohol swab and dried with gauze. A Tenderlet lancet was used to prick the finger with the first drop of blood wiped away with gauze. A sample of approximately 0.1 µL to 0.5 µL of blood was placed on the testing strips to be analyzed. Total cholesterol, high density lipoprotein (HDL), low density lipoprotein (LDL), triglycerides, glucose, and total cholesterol to HDL ratio were measured using a blood lipid plus glucose cassette in the Cholestech LDX analyzer (Cholestech Corporation, Hayward, CA). A blood sample was also analyzed for glucose tolerance using a One Touch Ultra 2 Glucometer (Life Scan Inc, Columbus OH).

Immediately after the first two blood samples were taken, a 16 ounce Crystal Light drink with 75 grams of dextrose added was consumed within five minutes. Non-fasting blood glucose measurements were then taken in two consecutive thirty-minute increments and again one hour later (total of two-hour time span). The first non-fasting glucose measurement was taken thirty minutes after the dextrose solution was finished. During the first thirty-minute wait, height and weight were measured and body composition was assessed using dual-energy x-ray absorptiometry (DEXA). Assessment took place using the GE Lunar Prodigy (General Electric Inc., Fairfield, Connecticut). The participant was asked to lie on their back, positioned on the machine according to protocol. They were asked to lie completely still, while breathing normally, and
closing their eyes while the scan took place (approximately 6 to 12 minutes). During the second thirty-minute wait, the participant was asked to complete a Health Related Quality of Life Survey (Appendix O). During the wait, the assigned dietary intervention was discussed, in detail, with the participant. This included allowed foods, restricted foods, shopping lists, recipes, and where to buy hard-to-find items (i.e. almond flour and coconut oil). The investigator also addressed completion of adherence charts and food intake records. Blood pressure was measured during the last ten minutes of the hour-long wait using a sphygmomanometer (Cosmed Tango, Rome, Italy). A blood pressure cuff was placed over the brachial artery of the right arm, slightly above the elbow. Pressure in the cuff was inflated to approximately 160 mmHg, and then deflated slowly to discern the systolic pressure (onset of heart sounds) and diastolic pressure (cessation of heart sounds) using a stethoscope. Post-testing sessions took place from November 6th to November 19th. Post-testing sessions followed the same protocol as pre-testing sessions; however, assigned dietary interventions were not discussed.

Assessment of variables

Body weight was measured to the nearest 0.1 lb. in minimal clothing and without shoes using a Health O Meter balance beam scale (Boca Raton, FL). Height was measured to the nearest 0.1 in. using a Health O Meter stadiometer (Boca Raton, FL) under the same conditions. BMI was calculated by converting weight and height into metric units and using the following equation: kg/m². Dual-energy x-ray absorptiometry (DXA) was used to estimate body composition data through the whole body scan. Assessment took place using the GE Lunar Prodigy (General Electric Inc., Fairfield, Connecticut). Blood pressure measurements were taken using a digital sphygmomanometer (Cosmed Tango, Rome, Italy). Fasting blood samples for lipid analysis were measured using a blood lipid cassette and Cholestech LDX analyzer (Cholestech Corporation, Hayward, CA). Blood glucose levels were determined using a One Touch Ultra 2
Glucometer (Life Scan Inc, Columbus OH). All blood samples were collected via fingerstick, using Tenrderlet lancets to prick the finger.

*Statistical analysis*

All data were analyzed using IBM Statistical Package for the Social Sciences version 20.0 (Armonk, NY). Data and results are expressed as mean ± standard deviation. One-Way ANOVA test was used to identify any between group differences. Paired-samples t-test was used to identify any within group differences. A p-value of $p < 0.5$ was considered statistically significant.
Results

Twenty eligible participants were included in the study; ten per group. Six participants (three from each group) were unable to complete the study; two participants stopped responding to e-mails, one participant was unable to finish for monetary reasons, one participant was unable to finish for family reasons, and two participants were unable to follow the dietary protocol. Fourteen participants completed the study (twelve female, two male). Mean age of the PD group was 44.1 ± 13.5. Mean age of the MPD group was 41.7 ± 12.3 (Figure).

Discussion

We found that following a five-week, modified Paleolithic-type diet, allowing three open meals and two open snacks per week, yielded metabolic and psychological improvements similar to those obtained from following a five-week, full-scale Paleolithic-type diet. Although many ‘Paleo’ books, such as Loren Cordain’s *The Paleo Diet*, have discussed the psychological benefits of following a Paleolithic-type diet, such as improved sleep and energy levels, this is the first study of its kind to highlight such benefits with a modified version [7]. Findings of the Health Related Quality of Life survey indicated that general health and energy levels were found to significantly improve within both groups, showing no significant differences between the groups. In addition, days ‘feeling worried, tense, or anxious’ and days ‘not having gotten enough rest or sleep’ significantly decreased within only the MPD group. This suggests that one can obtain the same if not better psychological improvements from a modified Paleolithic-type diet as they would from a full-scale Paleolithic-type diet. To date, a few studies have already demonstrated the metabolic benefits of following a full-scale Paleolithic-type diet. Such findings include increased insulin sensitivity, lower blood pressure, decreased weight, decreased BMI, and reductions in total cholesterol, LDL, and triglyceride levels [8-14]. While this study found no significant improvements in cholesterol levels and glucose tolerance within either group, we did find significant decreases in weight, BMI, and fat mass within both the PD and MPD groups, with no significant difference between the groups. The findings of this study suggest that one wanting to improve their metabolic status in the way following a Paleolithic-type diet has been demonstrated to do, can potentially do so by following a less-restrictive, modified Paleolithic-type diet.

We were surprised to find no significant improvements in cholesterol and triglyceride levels. This may be due to the small sample size. In addition, we were surprised to find that an equal
number of participants dropped from each group, since we were expecting to find fewer participants drop out from the MPD group than from the PD group. However, two of the three excluded participants from the MPD group dropped due to monetary and family reasons, whereas those who dropped from the PD group were either unresponsive to follow up contact or unable to fulfill the dietary protocol. It is noteworthy that when asked whether or not they would continue their assigned diet regimen in the future, every participant that finished the study stated they would with or without some minor adjustments. The majority of the participants in the PD group stated they would adjust their diet regimen to one that more closely resembled that of the MPD group.

It is still unclear as to the effecting mechanism behind the improvements observed in this study and others before it. Prior studies discussed a need for further research in order to determine this mechanism [10-12]. One study, which allowed its subjects to eat ad libitum, noted a lower reported energy intake in the Paleolithic diet group compared to the Diabetes diet group. The study noted that this reduced energy intake could evidently be a major explanation for the metabolic improvements achieved by the participants, and that further research into possible mechanisms is needed [11]. Another study, involving domestic pigs, reported that the group consuming a Paleolithic feed was consuming fewer calories than the group consuming a Western diet-based feed, and that the decrease in weight in the Paleolithic feed group associated with the decreased caloric intake could be the effecting mechanism behind the metabolic improvements, as opposed to the difference in macronutrient distribution between the feeds [12]. Furthermore, a study involving a short-term, three-week Paleolithic diet intervention indicated the need for further investigation of other diet regimens compared with Paleolithic-type diets in order to determine relative health efficacy [10]. Thus, although the beneficial effects of a Paleolithic-type diet have been demonstrated, it still remains unclear as to whether the effecting mechanism is energy intake related or due to the macronutrient distribution and choice of foods on Paleolithic-type diet.
Further investigation of the effecting mechanism is necessary, such as testing the effects of varying the macronutrient distribution of a Paleolithic-type diet. In addition, several limitations of the present study exist, which should also be corrected in future studies. The small sample size of twenty people may have affected significance of results. Insulin sensitivity results, which have been shown to greatly improve from following a Paleolithic-type diet, were excluded from this study due to inaccuracy of and error in calibration of the One Touch Ultra device. Future studies should utilize venous blood samples, as opposed to finger samples, when testing for metabolic variables such as glucose tolerance and cholesterol levels.

The future of the Paleo diet is promising. Its metabolic benefits can reduce risk of heart disease, type II diabetes, and many of the chronic degenerative diseases that plague western society. However, further research is needed to determine how the diet can be adjusted to suit modern society in a way that still yields similar benefits to those obtained from following a full-scale Paleolithic-type diet. As evidenced by the attrition rates of this study, even a less restrictive Paleo diet can be difficult to follow. However, there were no significant differences in metabolic improvements between the full-scale and modified groups, suggesting that a modified Palolithic-type diet may be a step in the right direction toward defining a new modern ‘Paleo diet’.
Appendix A. Informed Consent

James Madison University

Department of Health Sciences

Consent for Investigative Procedure (Informed Consent)

You are being asked to participate in a 6-week research study comparing two dietary interventions that is suggested to improve risk factors for cardiovascular disease and type II diabetes. These risk factors include weight, blood pressure, blood glucose tolerance, total cholesterol, LDL cholesterol, HDL cholesterol, and triglycerides. The study will be conducted by Charlotte Martin and Dr. Jeremy D. Akers from the Departments of Health Sciences at James Madison University. All laboratory procedures will be administered in the Human Performance Laboratory in Burrus Hall. The purpose of the current study is to compare the effects of the two dietary interventions on body weight, blood pressure, blood lipids, BMI, and blood glucose.

Research Procedures:

Note: In the event you discover that any of the following information is not clear, please ask one of the investigators to explain immediately.

Should you decide to participate in this research study, you will be asked to sign this consent form once all your questions have been answered to your satisfaction. You will be asked to complete a health history questionnaire which will be reviewed prior to your participation in the study. Your involvement in the study will involve an orientation session, pre-test measurements, randomization to a 6-week modified dietary intervention, and post-intervention testing.

In this study I understand I will be randomly assigned to one of two dietary intervention groups:

Dietary Intervention 1: Participants in this group will be asked to consume a diet consisting of fruits, vegetables, lean meats, eggs, and nuts. They will be given extensive information on allowed foods, restricted foods, shopping lists, and recipes.

Dietary Intervention 2: Participants in this group will be asked to consume the same diet as the participants in the other group and will be given the same extensive information; however, they will be allowed to consume three ‘open meals’ and two ‘open snacks’ per week. Participants will not be given food or beverage modifications for the open meals/snacks.

Participants will be trained on how to correctly complete a 4-day food intake record during the orientation session. Participants will be required to complete a 4-day food intake record per week, starting on the Wednesday of each week, for six weeks. Participants will also be required to complete a simple, diet adherence chart each week. Both the food intake records and the adherence charts can be e-mailed at the end of each week to the lead investigator.
The study will consist of various supervised lab tests, body composition, blood lipids and glucose, and resting metabolic rate.

In this study I understand the following measurements and tests will be taken:

• Before measurements will be taken you will be asked to complete a Health Status Questionnaire to assess your current health prior to participation in the study. You will also be asked to complete a Health Related Quality of Life questionnaire which you will assess your current mental and physical health status. These questionnaires will take approximately 20 minutes to complete.

• Dual-energy x-ray absorptiometry (DEXA) will be used to assess body fat, and muscle tissue. A whole body scan will be measured at the beginning and conclusion of the study. The importance of these measurements is to determine any changes in body fat and/or muscle mass during the intervention. Each scan will last approximately five minutes. Excess body fat is associated with chronic diseases such as hypertension, type 2 diabetes, stroke, coronary heart disease, and hyperlipidemia. According to the manufacture’s specifications, one DXA scan exposes subjects to 1.5 mrem of radiation. The exposure to radiation during a single chest x-ray (i.e., 5 mrem) is more than 3 times greater than radiation from DXA. Also, background radiation from DXA is about equal to the amount of radiation an individual experiences during a flight from New York to London.

• All blood samples will be collected via fingerstick. You will be asked to report to the lab after a 8-10 hour fast and well hydrated to increase blood flow. The finger will be prepped with an alcohol prep pad and pricked using a Tenderlet lancet and a blood sample will be collected using a capillary tube. The sample will be placed into an appropriate analyzing machine. Values for all blood samples will be recorded and explained at the completion of the study.

• Blood Pressure. After a 5 minute rest, blood pressure measurements will be taken using a blood pressure cuff. A blood pressure cuff will be placed on the upper portion of the right arm, slightly above the elbow. Pressure in the cuff will be inflated and then deflated slowly to discern the systolic pressure (onset of heart sounds) and diastolic pressure (cessation of heart sounds) using a stethoscope.

• Oral Glucose Tolerance Tests is where glucose is given and blood samples taken afterward to determine how quickly it is cleared from the blood. The test is usually used to test for diabetes, insulin resistance. For the test, you will be asked to drink a sugary liquid and have 5 minutes to consume the mixture. Your blood will be taken at 1 hour and 2 hours after you drink the solution. The test takes up to 2 hours.

• Resting Metabolic Rate (RMR) will be assessed by a handheld device to measure how many calories your burn at rest by measuring the amount of oxygen consumed. Researchers will administer the RMR test while you are rested and in a comfortable state. Measurements are made in a quiet, temperature controlled room. The researcher will place a sterilized noseclip on your nose and the researcher will test that you cannot breathe out your nose. You will hold the MedGem and insert the disposable mouthpiece in your mouth and breathe normally. The test will be 5-10 minutes.
**Time Required:**
Total time to complete the test sessions is estimated to be: test session #1 (eligibility screening, 10 minutes), test session #2 (orientation session, 45 minutes), and test sessions #3 and #4 (3 hours each). Test session #1 will be completed over the phone or by e-mail. Participants will be asked to come to the Human Performance Lab in Burrus for test sessions #2, #3, and #4. Test session #2 will involve discussing research procedures, informed consent, and food intake records. Test session #3 will involve discussing the assigned dietary intervention, handing out packets of information regarding the assigned dietary intervention, and completing pre-tests and measurements. Test session #4 will involve completing post-tests and measurements.

**Risks:**
Participation in this study poses minimal risk. Risk may include slight bruising at the fingerstick site. All researchers will observe extreme caution handling blood. This risk is considered to be minimal and all safety precautions for handing blood samples will be followed according to OSHA protocols. Please remember that are under no obligation to complete the study and could drop out at any time, for any reason. The researchers are trained to complete all assessments.

**Benefits:**
Potential benefits from participation in this study include free testing of body composition, c-reactive protein, glucose, and lipid profile. Participants will also learn about dietary intake and their percentages of energy nutrients and total caloric intake. The researchers expect to see positive metabolic changes for participants that may result in improved health and general well being.

**Confidentiality:**
All data and results will be kept confidential. Participants will be assigned an identification code. At no time will a participant’s name be identified with individual data. The researcher retains the right to use and publish non-identifiable data. All data will be secured in a locked cabinet in a locked office. Upon completion of the study, all information that matches up individual respondents with their answers or fitness test results will be destroyed.

**Participation and Withdrawal:**
Your participation is entirely voluntary. You are free to choose not to participate. Should you choose to participate, you can withdraw at any time without consequences of any kind.

**Reporting Procedures:**
Each participant will receive data pertaining to their own, individual test results following pre- and post-testing. No researcher will deny a participant of any information related to their own test results. Data obtained in this project will be presented at national or regional conferences and/or be published in national journals.

Appendix C. Food Intake Records

Instruction for Completing Food Intake Records:

For a complete diet analysis, it is important to record an accurate measure of the amount of food and beverages you consume. You may choose to measure food/beverage items before you consume them. Most people underestimate how much they eat. Record the quantity and name of all food and beverages you consume for 3 days consecutively.

- Eat and drink as you normally would. Please do not change your usual eating habits; no one is judging you! This is a valuable tool and you want it to be accurate!
- Record EVERYTHING you eat and drink (including diet drinks, water, etc.), please be specific.
- If possible, use measuring spoons and cups. Record serving sizes of meats in ounces or by the piece (1 thigh, 1 breast of chicken, etc.). Measure or estimate the volume of fluid in your glass or cup (4 fl oz, 8 fl oz).
- Describe the method of food preparation – baked, fried in butter or vegetable oil, barbequed, etc. ALSO, specify ‘dry’ or ‘cooked’ for items such as rice and pasta. For example, did you measure 1 cup of dry pasta and record that amount before cooking it or did you consume 1 cup of cooked pasta and recorded that amount?
- Don’t forget to write down all the little “extras” like sugar in your coffee or on your cereal, fruit on your cereal, butter on your vegetables or bread, honey in tea, mustard, mayo or ketchup on sandwiches, cream in coffee and so forth.
- Fully describe the food: 2% milk, water packed tuna, lowfat cottage cheese, low salt Wheat Thins, tomato soup made with whole milk, sugar-free Jell-O, canned peaches in heavy syrup, etc.
- Check food labels for weights (oz, etc.) such as candy bars, individually wrapped cheeses, cookies and juices.
- Combination foods like stews, sandwiches, and casseroles can be entered by ingredient amount.
- Please record (somewhere on the food log) all vitamin, mineral, and herbal supplements in mg, that you take.

Thank you for agreeing to participate in this study. We appreciate your time and dedication to advancing the scientific dietary information available to the public. Your participation in this study involves following the dietary intervention for the majority of your meals. The diet is composed mainly of lean meats, vegetables, fruits, eggs, seafood, and nuts with no intake of cereals, dairy, sugars, refined carbohydrates, and processed foods. You are asked to follow this diet for every meal/snack consumed except for three meals and two snacks per week in which you are not restricted on what you consume. These meals/snacks are referred to as ‘Open Meals/Snacks’.

Dietary Intervention: You are allowed to eat ad libitum, meaning you will not be restricted on the number of calories you eat per day. However, you are not allowed to completely avoid consumption of any of the three main food groups of this intervention: lean meats, fruits, or vegetables. It is recommended that lean meats make up about half of your caloric intake. The next section includes extensive lists of foods that are allowed/not allowed and a two-week sample meal plan. You are also provided with shopping lists and recipes.

Open Meals/Snacks: You may consume whatever you like for these meals/snacks. However, it is recommended that you make healthy choices, stick to appropriate portions sizes, not eliminate fruits and vegetables, choose whole grain when possible, and not over-indulge in over-processed, fatty foods. Intake of such foods may potentially cause discomfort, as your body will not be used to eating such foods for the majority of each week. You are provided with sample meal plans that reflect what appropriate Open Meals/Snacks could be. However, this does not mean you are required to follow these guidelines, it is just highly recommended and encouraged. All Open Meals/Snacks consumed on non-food intake record days must be written down on a separate food intake record. You do not have to record the entire day if the meal was consumed on a non-food intake record day, just the details of that particular Open Meal/Snack.

We ask that you be 100% honest when filling out weekly meal charts and food intake records because any false information may skew results. You will be excluded from the study if more than 5 of your meals/snacks do not follow the assigned dietary intervention. You may drop out of the study at any time. If you have any questions, concerns, or are skeptical about a recipe or particular food/ingredient, you may call (703)-298-2502 or e-mail marti4ca@dukes.jmu.edu.
Appendix F. Intervention Dietary Guidelines (Participant Handout)

Some Guidelines:

1. Eat generous amounts of animal protein; this includes red meat, poultry, pork, eggs, organs (liver, kidney, heart…), wild caught fish and shellfish

2. Eat good amounts of fresh or frozen vegetables

3. Cut out all:
   • Cereal grains
   • Dairy
   • Legumes
   • Starchy vegetables
   • Vegetable, hydrogenated, and partly-hydrogenated oils
   • Sugar
   • Processed, refined foods

4. Eat when you’re hungry, do what feels naturally

5. As a rule of thumb, if it comes in a box, you probably can’t eat it. If something’s packaged and you think it might be allowed, the only way you can know for sure is by READING THE FOOD LABEL!

6. Learn your spices & herbs to make your food taste amazing and avoid boredom

7. Try to stick with coconut and olive oil for cooking

8. Use olive oil, nut oils (macadamia oil is good), avocado oil, and vinegars for drizzling over salad dressings

9. Ask your server about ingredients and cooking oils if you eat out

Appendix N. Weekly Adherence Chart Instructions

**Weekly Meal Chart Instructions**

For each meal/snack, make a check mark in the corresponding box if you followed the dietary intervention for that particular meal/snack.

Mark Open Meals/Snacks boxes with an asterisk (*).

If you already consumed your allotted number of Open Meals/Snacks for the week and consumed another meal/snack in addition to that, make an X in the box. Even if only a small part of your meal did not follow the assigned dietary intervention, you must still mark an X.

Leave snack boxes blank if you didn’t eat four snacks that day.

Leave meal boxes blank for any meals you skip (try not to skip many meals).

• 2 t dried oregano
• black pepper
• 2 T chopped parsley
Clean the octopus. Pull off the tentacles, remove and discard the intestines and the ink sac, eyes, and the beak. Skin the octopus, wash, and scrub it thoroughly to remove any traces of sand. Cut it into 1.5-2 inch pieces and place in a saucepan over medium heat to release the liquid. Stir the octopus until this liquid has evaporated. Pour on the oil and stir the octopus to seal it on all sides. Add the whole onions and cook them, stirring once or twice, until they color slightly. Add the wine, the lemon/lime juice, tomatoes, tomato puree, bay leaves, oregano and several grindings of pepper. Stir well, cover the pan and simmer very gently for 1-1.25 hrs, checking from time to time that the sauce has not dried out. If it does (if the heat is too high) add a little more wine or water. The octopus is cooked when it can be easily pierced with a skewer. The sauce should be thick, like a runny paste. If any of the liquid separates, remove the lid from the pan, slightly increase the heat and stir until some of the liquid evaporates and the sauce thickens. Discard the bay leaves and stir in the parsley. Taste the sauce and adjust the seasoning if necessary. Serves 4-6.

Pour the coconut milk and tomato mixture from on top of the scallops and ensure that they are all well coated. Finish it off by sprinkling the diced tomatoes over the scallops.

Cook until onions are translucent. Next, add the can of coconut milk and mushrooms to begin to cook down. Reduce the heat and let the flavors simmer. Reducing the heat is important so that the coconut milk doesn’t splash everywhere. Once the mushrooms become tender, use your grater for some fresh ginger directly into the pan. Mix together. Add salt and pepper to taste and cover to let cook while you cook your chicken. Now put your medium skillet over medium-high heat and add a bit of oil to your pan. While the pan heats, season your chicken thighs with salt and pepper along with the garlic and onion powder. Add chicken thighs to pan and cook on both sides for 4-6 minutes, depending on thick the thighs are. Once the chicken is almost done cooking, add them directly to your coconut milk pan, cover and let cook for about 3-5 minutes to let the chicken absorb some of the liquid. Now they are ready to eat, try serving with some broccoli.

**Pork and Chicken Stir Fry**
- 1 lb boneless chicken
- 1 lb boneless pork chops
- 1 12 oz pre-cut broccoli
- 1 12 oz julienne vegetable mix (carrots, broccoli, cauliflower and cabbage - if using frozen vegetables be sure to allow moisture to evaporate before cooking)

- 5 T olive oil
- 1 t pepper
- 2 T chopped garlic

- 1 T roasted sesame seeds

Preheat 12 inch non-stick skillet or wok to medium high. In batches so as not to crowd, stir fry chicken and pork with olive oil and pepper (3 batches requires 1 T olive oil for each). Takes 1-2 minutes for each batch.

Remove cooked meat from pan and set aside. Add 1 T olive oil to pan with broccoli and julienne vegetables. Cover skillet with lid 3-4 minutes. Remove lid and stir fry by tossing consistently for 1 minute. Clear area in center of pan with spoon and add garlic and red pepper. Cook 1 minute. Add a few onion wedges into the cavity, along with a few sprigs of herbs. You do not need to remove the rosemary from the stalk. Add a half of the lemon slices to the cavity. If you still have more space in the cavity, add more grapes. Rub olive oil over the outside of the chicken. Line the bottom of a roasting casserole dish with onion slices and lemon slices. Place the chicken in the roasting pan, on top of the lemon wedges and onion, breast side down (or use a roasting rack). Sprinkle outside of chicken with salt and pepper. Place sprigs of herbs and slices of lemon between the wings and the body of the chicken. Arrange any remaining grapes, lemon slices, and herbs around the sides of the chicken. Roast at 350 F for about 20 minutes per lb. Baste with the juices from the chicken and the white wine several times during the cooking. The chicken is done when the juices run clear (not pink) when a knife tip is inserted into both the chicken breast and thigh, about 165-170 F for the breast and 180-185 F for the thigh.

Duck

Roasted Duck with Blueberry Sauce

- 1 whole duck, cut into quarters, all excess fat removed
- dried shallot and black pepper spice mixture
- fresh or dried garlic
- ground ginger
- 1/2 Granny Smith apple
- 1/4 onion, peeled
- 1 c blueberries
- 1/4 c raw honey
- 1/4 t ground cloves
- grated zest of 1/2 lime
- grated zest of 1/2 orange
- 1/4 c wine (white or red)

Quarter the ducks, remove any excess fat, and rub with a mixture of the shallot/pepper mixture, garlic, and ginger in a 1:1:1 ratio. Place the duck, skin side up, on a rack in a roasting pan (you may need two pans for the eight quarters). Cover them with plastic wrap, sealed tightly, and place into the refrigerator until three hours before serving.

Peel, quarter, and core the apple. Put the onion and the apple in a food processor and finely chop. Put them into a saucepan with the blueberries, honey, ground clover, zests, and wine. Over high heat, bring the mixture to a boil, then simmer until pulpy and beginning to thicken, about 30 minutes. After 20 minutes, the mixture will appear liquid, but after 30 minutes, it will begin to thicken. When cool, it will be more of a sauce. Pour the sauce into a sterilized jar, and cover tightly. If you are serving the duck within 24 hours, leave the sauce at room temperature; otherwise refrigerate.

Preheat the oven to 375 F. Approximately 2.5 hours before serving, put the duck into the preheated oven. Empty fat from the pans if needed to avoid spillage. A half hour before serving, raise the temperature to 450 F. The duck should be crispy and tender when done. Serve each quarter with about 1/4 c of sauce poured over. Serve extra sauce on the side. You can remove the rib bones from the duck before serving. Serves 4.

Add the scallions and water; mix and cover with a lid.

Cook over medium heat and toss a couple times until the cauliflower is soft, about 10 minutes. Uncover, fold in the coriander, and continue stir-frying until excess moisture evaporates and the cauliflower looks glazed, about 5 minutes.

- 3 carrots
- 2 medium onions
- 3 stalks of celery
- Dried Basil, Rosemary, Oregano, Unrefined sea salt, + Pepper
- Apple Cider Vinegar (1-2 T)
- Water {Around 11-12 c}
Rinse off your chicken put it in a big soup pot { Make sure you take out giblets / neck if it’s included). Chop your onions in quarters. Cut the carrots in half and the celery, rinse and add it in. Top with spices, just do a good sprinkling of all of them, but limit the unrefined sea salt. Top with water, it should more than cover your chicken { like maybe an inch or two above it}. Bring it to a boil, then reduce to low and simmer for about 3-3.5 hours { uncovered… if you start to get really low on liquid feel free to top with some more water}. When it’s done, pull out the chicken, get a big bowl and a strainer and strain the liquid, set aside. Set the stock on the side to cool, then shred all the meat with your fingers { or two forks} and put into separate bowl and then toss the veggies/carcass. When stock is room temperature, cover and put in fridge. Next morning, skim off fat and it’s complete. Either put into containers to freeze or stick in the fridge to use soon.

Stir through basil, parsley and nuts to give a smooth very thick sauce. If the mayonnaise curdles, continue its preparation to the finish. Beat another egg yolk in a clean bowl and gradually whisk in the curdled sauce. The mayonnaise keeps, covered and chilled, for up to 24 hours. Cool in the pan for 15 minutes, then turn out onto a wire rack to cool completely.

Anything could be put in place of the carrots (pumpkin, zucchini, etc.) since the vegetable is pureed first.
**Carrot Cake Cupcakes**

- 1.5 cups raw cashews (unsalted)
- 5 T Coconut Cream Concentrate
- 1/3 cup canned coconut milk
- 1 tablespoon Raw Honey
- 2 ts vanilla
- 1/2 t cinnamon

Preheat your oven to 350 degrees. Shred your carrots in your food processor with the shredding attachment or use a grater. Add all the carrot cupcake ingredients to a large bowl and mix thoroughly to combine. Place cupcake ingredients into a muffin tin lined with paper liners or silicone liners (like I use). Should fill 10-12 muffins. Bake for 18-20 minutes. Now on to make the frosting! Add your cashews and turn on until you get a chunky meal. Then add your 5 tablespoons of coconut creme concentrate. Once that has combined, add your coconut milk, honey, vanilla, and cinnamon. When you get a paste/frosting, taste to see if you would like any salt added. Once your cupcakes are done baking, let cool COMPLETELY, cut in half and place frosting between the two halves and on top of your cupcake. Sprinkle with cinnamon or extra shredded carrot OR a bit or orange zest!
**Chestnut Cake**  
- 600g chestnut flour  
- 3 T olive oil  
- 70g raisins  
- 40g pine nuts  
- 40g walnuts  
- rosemary

Sift the chestnut flour into a mixing bowl and gradually add 800ml of water, whisking continually to avoid lumps forming, until you have a smooth paste, neither too runny nor too thick, but forming ribbons when it falls from the spoon. Soak the raisins and squeeze out the excess water. Add two T of oil, and then the raisins, pine nuts and shelled walnuts to the batter. Pour the mixture into a shallow, greased baking tray (the cake should only be about 1cm high), sprinkle some rosemary leaves on top and drizzle a T of oil over. Put in the oven for thirty minutes. Leave aside for about half an hour before serving, as the cake should be eaten either tepid or cold.

- 1/2 c unsweetened cocoa powder  
- 1 t baking soda  
- 1/2 t unrefined sea salt  
- 1/2 c strong brewed coffee

Place the medjool dates in a food processor and pulse until completely pureed. Add applesauce (or banana) and continue to pulse until pureed and combined with the dates. Add the fruit purée to the bowl of a stand mixer, add the eggs, vanilla, coconut oil and coffee and mix on low-medium speed until well combined. Combine the dry ingredients in a separate bowl. Slowly add the dry ingredients into the wet ingredients and mix on low-speed, scraping down the sides, until you have a smooth batter. Grease a 8×8 glass pan with coconut oil, pour in the batter and smooth it with the back of a spatula. Bake at 350 degrees for 30-35 minutes or until a toothpick stuck in the middle comes out clean.

- 3.5 oz Unsweetened Dark Chocolate
- 1 c squeezed orange juice
- 2/3 c raw honey
- Unrefined sea salt
- 5oz Nuts of your choice

In a small sauce pan, heat the orange juice on medium heat. As it starts to simmer, reduce heat to low and add the chocolate. It should take a few minutes for the chocolate to completely melt, but once it has, slowly pour in the honey while stirring the melted chocolate. Once the honey, chocolate and orange juice are mixed thoroughly, give it a taste. Take the nuts of your choice and drop them in the chocolate. Mix the nuts around until they are fully coated and then scoop each one out with a fork and place on parchment paper. Sprinkle a tiny bit of unrefined sea salt on each nut. Put in the refrigerator and let cool.

**Coconut Pound Cake with Strawberries**

- 1/2 C raw honey
- 1 t. vanilla extract

- 1/4 t. cinnamon
- 1/8 t. unrefined sea salt
- Coconut oil
Preheat oven to 350 degrees. Beat the eggs with the coconut milk, honey and extracts, until smooth. Add the coconut flour, baking soda and salt. Mix until a smooth batter forms. Grease a loaf pan with coconut oil, and sprinkle with some coconut flour to lightly coat pan. Pour batter into the loaf pan. Allow the pound cake to cool before removing it from the pan.

**Crepes with Apple Filling**
- 1/4 c canned coconut milk
- 1/4 c coconut flour
- 8 egg whites
- 2 whole eggs
- 2 T melted coconut oil
- 1/4 t vanilla (optional)

Beat the egg whites and eggs with a wire whisk or hand mixer until a little frothy. Then sift your coconut flour and add it in along with the remaining ingredients and beat really well. Heat a small skillet over medium heat with a little bit of Coconut oil in the pan so they don't stick if you are using a stainless steel pan, let it start smoking then pull the pan off the heat for a bit. Reduce the heat to low and pour in a small amount of batter (about 3-4 T) and swirl it around in the pan to coat the bottom and sides of the pan thinly. Cook for a few minutes, watching closely, when the edges start to curl, flip it over and cook the other side. I like to use a silicone spatula to loosen the edges a bit while it’s cooking so it doesn’t stick. It usually takes less time on the second side. Remove from the pan and either set aside or fill with your filling of choice either savory or sweet, fold and eat. Repeat these steps applying more coconut oil as needed to the pan (you don’t need to heat it up just add at low temp). This will make about 10 thin crepes.

**Filling**
- 4 Fuji apples sliced very thinly (about 7-8 c)
- 1/4 c coconut oil
- 1/2 c raisins
- 1 c canned coconut milk
- 1 T cinnamon

When your oil is all melted add the apple slices and sauté over med-high heat or high heat until softened. Then lower heat to medium. Add in the coconut milk, raisins and cinnamon and simmer stirring occasionally until it thickens up nicely and makes a sauce, usually just a couple of minutes. And then they are ready to serve.

Fold in your dried cranberries and ensure an even distribution by hand. Using your cookie scoop, place scoops of cookies on a parchment lined baking sheet leaving room between the cookies because they will slightly expand. Using the back of a spoon or your hand, slightly flatten the cookies. Bake in the oven for 10-15 minutes or until done but ensure you continually check it so you don’t burn them, some peoples ovens will be hotter than others. Remove from the oven, place on a cooling rack or plate.
