## Accident report

Details of this accident have been withheld by the demining NGO that employed the Victim. A spreadsheet including the Victim's name and very brief details of the accident was made available in 2007. Some details can be inferred from the information released. For example, the injuries imply that the victims were not wearing PPE, or not wearing it in the correct manner.

This entry will be expanded if access to the report of the investigation is made available in future.

The spreadsheet data is reproduced below, edited for anonymity.

"Date and country. [Names of four Victims removed] - deminers

[Victim No.1] Fragmentation injuries, also suffered traumatic amputation of right hand.

[Victim No.2] Fragmentation injuries in face, eyes and legs.

During post clearance phase Mine accident - V69 explosion.

Four victims are listed and two summaries of injury, from which it is inferred that the last two listed victims suffered only minor injuries.

## Analysis

The primary cause of this accident is listed as a "Field control inadequacy" because the accident occurred in the "post-clearance" phase so the mine had either been missed during clearance, or was outside (but close to) the cleared area, so implying inadequate survey. The fact that four deminers were injured implies that the Field controllers believed they were in a safe area, or that safety distances were being ignored. The spread of injuries indicates that protective visors were not being used.

The secondary cause is listed as a "Management control inadequacy" because the management of the demining group declined to make the accident details available. Although this is sometimes done to protect the Victims, in this case the Victims' names were among the limited detail made available. It is possible that the managers have chosen to avoid transparency because they are afraid that the circumstances of the accident would reflect badly on their organisation.
