</tbody>
</table>

Table 1: Factors that affect the costs of manual demining.

Table 2: Costs for mechanical mine clearance in Sri Lanka.

The other most important factor concerning demining efforts in Sri Lanka, after speed and efficiency, is cost. Table 1 shows the factors that affect the costs of manual demining and mechanical mine clearance. By comparing Table 1 to Table 2, one can see the operating costs of demining machines is lower than that of manual demining. However, the most problematic element to mechanical demining is the initial capital expenditure on the machine itself. Sri Lankan technicians are not familiar with the technology behind the machines mentioned above; therefore, after the warranty period, maintenance costs will be high because the machines will require specialists to fix them and the parts are difficult to find.

Conclusion

When considering the challenges of demining in Sri Lanka, it is vital to understand the importance of developing new technologies or introducing existing current technology to improve the efficiency of the task—only with proper training. Humanitarian-demining efforts in Sri Lanka are daunting, not only the threat in the ground but due to the tenuous situation between rebel groups and the Sri Lankan government.

2006 UNMAO Planning Process in Sudan

A national strategic framework for mine-action efforts in Sudan drives the development of several planning documents that involved several national and international organisations to ensure the successful implementation of a successful framework. The author discusses the development process for the various national mine-action planning documents.

By Hansie Heymans | United Nations Mine Action Office in Sudan |

The Annual Operational Plan is the final output for the overall mine-action planning process. This process follows directly from the Mine Action Strategic Framework that was developed and signed in 2004. Based on the framework, the United Nations used the Portfolio of Mine Action Projects’ process to develop a list of proposed projects for various mine-action players. From the prioritisation process, mine-action stakeholders such as the United Nations, local authorities and nongovernmental organisations (fiscal and internationally) developed and agreed upon the United Nations and Partners 2006 Work Plan for Sudan.

Based on both these processes, stakeholders developed the 2006 Annual Operational Plan using the logical framework analysis. Figure 1 illustrates the overall process followed in Sudan to develop three separate but interconnected documents for mine-action planning. The results of these three processes are:

- Portfolios of Mine Action Projects for Sudan
- United Nations and Partners 2006 Work Plan for Sudan
- Mine Action Annual Operational Plan for Sudan

The processes are listed in the centre blocks of the figure (e.g., input from stakeholders, Portfolio and Work Plan; and regional priority development and priority setting). The final products of the three processes were the 2006 MAP document, the Work Plan for 2006 and the 2006 Annual Operational Plan.

Mine Action Strategic Framework

The Mine Action Strategic Framework was developed in 2004. The United Nations Mine Action Service and the United Nations Development Programme jointly led this process, which involved the authorities from both North and South Sudan. The government of Sudan (GoS) and the Sudan People’s Liberation Movement both agreed upon and approved the MAP. The document was developed before the GoS and the SPLM signed the Comprehensive Peace Agreement and consequently was revised in 2006; therefore, the MAP will be used to guide the planning process. The development of the Portfolio and the 2006 Work Plan should be guided by the overall strategic priorities identified in the document.

The preparation and the development of the Portfolio of Mine Action Projects started in June 2005. Input was requested from U.N. agencies, national authorities and nongovernmental organisations. The MAP strategic priorities were used to develop project sheets supporting the MAP. Project sheets are used to submit and register a project in the MAP. The development of the MAP was facilitated through two review panels—one in the south representing the SPLM and one in the north representing the government of Sudan. The panels consisted of members from nongovernmental organisations, demining authorities and the UNMAO. The panels reviewed all project sheets, ensuring all projects support the MAP strategic priorities and were overseen and approved by both mine-action authorities. Participating U.N. agencies, national and international NGOs and the national mine-action authorities completed the final in-country review of all project sheets in August 2005 and submitted them to UNMAS/New York for review. Together, they submitted well over 30 projects.

2006 Work Plan

In June 2005, the U.N. Country Team started work on the Work Plan for 2006, developing U.N. Strategic Priorities for Sudan. Mine-action stakeholders developed the mine-action sector priorities using the MAP as a starting point. After these priorities were finalised, mine-action objectives were developed involving all mine-action partners. Both national mine-action authorities approved these objectives before they could be presented to the U.N. Country Team. As with the MAP, this process included other U.N. agencies, demining...
The process takes into consideration input from all mine-action implementing partners, local authorities and setting of priorities to relieve suffering more effectively and efficiently. See Endnotes, page 111

Landmines Affect Civilians and Military Forces

Landmines in two of the most heavily mined countries in the world, Afghanistan and Iraq, pose a constant threat to local populations. In 2004, the U.S. Campaign to Ban Landmines cited 261 Iraqi injuries or deaths from landmines. In the same period, 895 Afghans were injured or killed by landmines.

The landmine contamination also seriously affects United States Armed Forces serving in the two countries. Since 2001, more than 100 U.S. soldiers and service members have been victims of landmines in Afghanistan and Iraq. A fact sheet prepared by the USOBL cited 75 American casualties in Iraq and 55 in Afghanistan since 2003. The accidents have resulted in 35 death totals.
