WE TRAIN RATS TO SAVE LIVES

ANNUAL REPORT 2017
WE TRAIN RATS TO SAVE LIVES
Almost two decades ago, when I heard about a project that aimed to train rats to detect landmines, I was intrigued, though like so many who hear about the project for the first time, I admit I was skeptical of its success. But with a diploma in animal training and a worthy project based in Tanzania, close to my home city of Nairobi, it seemed like a good fit, and I secured a position as a rat trainer.

I soon travelled to mine-affected areas in Mozambique and experienced first-hand the terror, heartbreak, and long-term difficulties that hidden landmines impose on struggling communities. I met people who had lost loved ones or whose own limbs were lost because of landmine accidents. And there are many more who still could not get back onto their productive land, even though the conflict had ended decades ago. They were faced with a stark choice: live hungry...or work on land that might contain landmines. This is a decision that I’m sure very few of us have to face and cannot even imagine. After this sobering trip, I returned to APOPO’s HQ in Tanzania determined to help speed up detection of these insidious weapons.

Now, 20 years later, APOPO and the mine detection rats have helped to find and clear more than 100,000 landmines and other explosive items, getting hundreds of thousands of people back on their land and their lives on track. It’s these results that motivate me to come to work every day - because the landmines are still out there.

APOPO is an inspiring, progressive, and innovative place to work. The tuberculosis detection research that began in 2002 now shows a potential to raise partner clinics’ detection rates by 40%. We’ve also investigated the rats’ potential to tackle other global issues such as salmonella contamination, search and rescue in collapsed buildings, and trafficking of threatened wildlife and rare African hardwoods.

Altogether, over the last 20 years, life for me at APOPO has never been dull. This won’t be changing soon, and I’m proud to be part of something that will save many more lives in the future.

Happy birthday, APOPO!
GLOBAL TUBERCULOSIS

In December 2015, the World Health Organisation (WHO) announced that tuberculosis now kills more people per year than HIV/AIDS and malaria. In 2016, there were 10.4 million new cases of tuberculosis (TB) globally, and 1.7 million of these people died. Symptoms of tuberculosis commonly include poor appetite and weight loss, a persistent cough, fever, and weakness, leaving people unable to work. Without treatment, patients usually die, and they can spread the pathogen to up to 15 other people within a year, causing a vicious cycle that’s difficult to break.

APOPO’S SOLUTION

APOPO conducts research into developing and deploying rats as a TB diagnostic tool. Results show that the rats can check 100 samples for tuberculosis in 20 minutes. The same task would take a lab technician up to four days. This allows APOPO to recheck samples collected from partner clinics at a high speed and then confirm the presence of TB in the samples indicated by the rats using WHO-endorsed confirmation methods. Confirmed results are then sent back to clinics, who oversee patient counselling and treatment. The project indicates that APOPO can increase partner clinics’ detection rates by 40%.

SCHOOLKIDS AND LANDMINES

Our school is in the middle of land that used to hide landmines that were laid to defend a military camp during the war. After the war finished, the mines were left there, but marked safe areas around the school for the children to stay secure, but we still found them playing outside boundaries or sneaking out to retrieve a ball. Thankfully there were no accidents, but many of the children’s families have been affected. This is a farming community, and it is shocking to see the serious landmine injuries that can happen to people or livestock in the fields.

A child often has to leave school to care for someone in their family who is injured. Sometimes they never return, because they have to take the place of a breadwinner who cannot work. It is very sad, because from that point, their life without even a basic education will be hard work.

APOPO, together with their partner the Cambodian Mine Action Center, have now cleared all the mines from this area. Everyone is free to travel, work, and play as they like without being terrified. I am still affected, though. Even though I know the mines are gone, when I see the children playing in the fields, I still worry.

Bundoeth Thoung, School Headmaster, Khna Phtol, Cambodia

SINCE APOPO BEGAN, TO END 2017

107,385
Landmines and other explosives destroyed
22,699,534 M² Land given back to communities
953,338 People freed from the terror of landmines
462,684 Suspect TB samples screened
12,682 Additional TB cases detected
97,050 Potential infections halted

APOPO, together with their partner the Cambodian Mine Action Center, have now cleared all the mines from this area. Everyone is free to travel, work, and play as they like without being terrified. I am still affected, though. Even though I know the mines are gone, when I see the children playing in the fields, I still worry.

Bundoeth Thoung, School Headmaster, Khna Phtol, Cambodia

THE GLOBAL LANDMINE AND EXPLOSIVE REMNANT OF WAR (ERW) PROBLEM

Leftover landmines and explosives currently threaten almost a third of the world’s countries. They remain active and dangerous long after hostilities end, causing accidents, inflicting terror, and hampering the development of vulnerable communities. In 2016, landmines and ERW caused 8,605 casualties, 78% of them civilians and 42% of those children.

Landmines and ERW also hamper economic recovery and development in war-affected areas. Villages are cut off from basic necessities such as water supplies and essential travel routes, and communities are prevented from using fertile land for growing crops, raising livestock, or development.

APOPO’S SOLUTION

APOPO’s mine detection rats (MDR) are too light to detonate the landmines and are very quick, at finding them, making them a perfect tool for speeding up detection and clearance. When they are integrated into conventional mine clearance methods such as survey, machines, and deminers with metal detectors, MDR are proven to significantly speed up landmine detection, helping return safe land to vulnerable communities as quickly and cost-effectively as possible.
MINE ACTION

The APOPO team envisions their work within the context of the Mine Ban Convention (APMBC), which aims to achieve all outstanding obligations under the Convention, to the fullest extent possible, by 2025. Since its inception in 1999, APOPO has been focused on adapting the goal to accomplish all outstanding obligations under the Convention in a manner that is proven the use of animals for landmine detection. With rats, APOPO has developed and implemented a unique method to work efficiently in overgrown areas, without the need for manual or machine-based brush-cutting and hugely speeding up operations. The unique ability to work effectively in overgrown areas gives APOPO the proficiency and facilities to train and deploy animal detection teams on a commercial basis.

APOPO’s rats are a vital part of the APOPO mine action toolbox that includes manual deminers, flail and tiller machines, and armored brush-clearing excavators. In 2017, mine detection dogs were added when APOPO opened a dog training center in Cambodia.

The next step is to optimise the process of technical survey and clearance. APOPO has for 20 years developed and improved the use of animals for landmine detection. With rats, the overall efficiency of a clearance process can be doubled or tripled in other contexts. However, it is essential to maintain a consistently high standard of animal research, concept verification, and operational use of mine detection rats (MDR) for mine clearance. As a result, APOPO has established a Technical Survey Dog training center in Kampong Scnang, Cambodia, which is the first one focused on global deployment to mine-affected countries. APOPO has an excellent partnership with CMAC in Cambodia, allowing each organization to draw from the other’s resources and strengths, and the training center empowers some of the most experienced mine detection dog trainers in the world.

In 2017, eight mine detection dogs were fully trained by APOPO, and they are now leased to The Development Initiative (TDI) for survey and clearance in South Sudan under the auspices of the UN. A total of 15 to 20 more dogs will be trained in 2018. These dogs will be deployed in at least three different mine-affected countries when trained. APOPO mine detection dogs and dogs can be leased by partner organizations.

Håvard Bach has had a distinguished 26-year mine action career, with involvement in all aspects of mine action. He graduated from the Norwegian Military Officers Academy in 1987 and held several army positions in Norway. He headed the Norwegian engineering component to the United Nations Force in Lebanon (UNIFIL). He joined the Norwegian People’s Aid (NPU) in 1992 and set up its programs in Cambodia, Mozambique, and Angola.

Håvard also served as head of operational methods for the Ge- neral International Center for Humanitarian Demining (GICHD) from 1996 to 2008, and he was the driving force behind major global studies on animal detection, land release, and other operational methods of surveying and clearance. Håvard joined APOPO initially in 2002 and subsequently in 2016 as head of mine action. From 2013 to 2016, he was head of operational methods for NPU.

APOPO is uniquely positioned to develop scent detection animal applications following 20 years of experience in research, training, and operational use of mine detection rats (MDR) for mine clearance. Since 2010, APOPO has been involved in establishing a Technical Survey Dog training center in Kampong Scnang, Cambodia, which is the first one focused on global deployment to mine-affected countries. APOPO has an excellent partnership with CMAC in Cambodia, allowing each organization to draw from the other’s resources and strengths, and the training center empowers some of the most experienced mine detection dog trainers in the world.

POPO continued operations throughout 2017 in Siem Reap province alongside our partner the Cambodian Mine Action Center (CMAC). Together the APOPO/CMAC teams cleared nine minefields totaling 739,289 square meters of land, which was returned to the village communities for agricultural and infrastructure purposes. This directly benefited over 6122 people who were able to finally get back on their productive land.

Early in 2017, APOPO Cambodia received a further 16 mine detection rats (MDR) from our headquarters in Tanzania. Ten were integrated into operations and the remaining six began work at the new Visitor Centre in Siem Reap.

After just a few short weeks, the new MDR had achieved the high standard ready for accreditation from CMAC. All 10 rats passed their International Mine Action Standards (IMAS) tests and were immediately deployed in the Srey Nour area of the province.

Throughout the year, the program was supported by the CMAC explosive ordnance disposal (EOD) team funded by APOPO. The on-call team were kept busy visiting villages and farms in the area to investigate suspicious objects that had been uncovered, mostly old explosive items such as mortars and artillery shells. At each site, the EOD team carefully removed or destroyed the items. They also carried out mine-risk education sessions to familiarize communities with common explosive remains, warning them not to move the items, and to contact the EOD team as soon as possible.

Toward the end of the year, APOPO was extremely pleased when CMAC signed a new agreement that will keep the partnership going until the end of 2018.

The APOPO mine action programme in Cambodia is made possible by its partners and donors, the Cambodian Mine Action Centre, the Cambodian Mine Action and Victim Assistance Authority, the JTJ Foundation, the Photofund of Luxembourg, the UK Peoples Postcode Lottery, the Dutch Postcode Lottery, the Global Development Group, Basmati and Goldman Sachs.

_**Impact 2017**_

- Landmines and UXO destroyed: 2,349
- Safe land given back to communities (M2): 738,344
- People directly affected: 6,122

_Agnes Fitzpatrick_

**DIRECTOR OF GRANTS & CONTRACTS**

APOPO completed the first minefield in September 2017, successfully deploying its integrated system of mine detection rats, manual deminers with metal detectors, and a ground-preparation machine. APOPO and NPA identified and safely excavated 18 anti-personnel landmines, four items of unexploded ordnance (UXO), and 139 items of small arms and ammunition. Before landmines were resolved, the Uíge government will build a new municipal hospital to benefit 32,764 people or 6,553 families living in Quitexe municipality. In the meantime, members of the community have already begun expanding their farms - or lavaras, in the local language - to begin cultivating the formerly hazardous area. There are 350 people in 66 families living in direct proximity to the former minefield. At the time of writing, clearance of the second minefield is proceeding well, and it is expected to conclude in the first quarter of 2018.
In 2016, the Zimbabwe Ministry of Defence assigned to APOPO the clearing of a minefield in the south of the country. The team arrived in Harare in September 2017 and spent the rest of the year setting up office, surveying the mine area, and reaching out to potential donors in efforts to bring funding up to operational levels.

The assigned minefield is laid in very dense belts (reportedly 5,500 mines per linear kilometer) forming a “cordon sanitaire” that runs for 37 km southeast along the border with Mozambique. The total task area is over 7,181,000 m² and is extremely remote, bordering one of the wildest national parks in Zimbabwe, Gonarezhou National Park. Gonarezhou itself is within one of the largest conservation areas in the world - the Great Limpopo Transfrontier Park (GLTP). The GLTP is part of a bold African vision to combine three unique national parks (Gonarezhou NP in Zimbabwe, Kruger NP in South Africa, and Limpopo NP in Mozambique) by removing all human barriers so that wildlife, and tourists can roam freely within the huge ecosystem covering some 35,000 km². The minefield is located in the Sengwe Wildlife Corridor, an area specifically designated to allow for the free movement of wildlife between Kruger NP in South Africa and Gonarezhou NP in Zimbabwe. These parks boast two of the largest African elephant populations on the continent. Due to its remoteness, documentation regarding the environmental impact of the minefield is scarce; however, its location in the heart of such a conservation area suggests that the toll on wildlife must be significant. Several elephant deaths a year are reported, but while only cases involving elephants have been documented, the area is rich in other endangered mammal species that are undoubtedly affected too. Communities are also affected on both sides of the border, and it is estimated that tens of thousands of people are heavily impacted by the landmine problem within APOPO’s area of responsibility, with occasional human and regular livestock accidents being reported. The area is extremely dry and unsuitable for agriculture, and livestock are people’s main livelihood. Zimbabwe is a signatory of the Mine Ban Treaty, under which it committed itself to free the country of all landmines by 2025, but as global funding diminishes, this goal is under threat. However, following a peaceful changeover of political leaders, the country is optimistic for the future, and we believe that slowly but surely, the economic situation will improve and investment will begin to flow back, vastly improving the funding situation. The early part of 2018 will be spent cementing connections made, and we hope to be up and running by midyear. The APOPO Zimbabwe Mine Action program is made possible by its partners the Zimbabwe Mine Action Centre (ZIMAC) and the Zimbabwe Ministry of Defence. The program also thanks its donors for their generous support, including: the UK People’s Postcode Lottery, the Dutch People’s Postcode Lottery and the Embassy of Australia in Zimbabwe.

Mozambique declared itself landmine-free in 2015, marking an end to decades of distress and suffering. It is one of the largest mine-affected countries, cleared of landmines. APOPO is proud to have been a part of the Mozambican success story, working with the AP Mine Ban Convention (APMBC) and involved as an example to follow. APMBC was a part of a collaborative effort between international NGOs, the UN, and the Instituto Nacional de Desminagem (IND) to clear Mozambique of mines. However, there is still a small residual risk of explosive remnants of war (ERW) in the country, and a reactive national response capacity has been created to address this problem. One specific area, the Matibane Complex in the district of Kamwankwe, is still under threat from ERW, with ongoing surveys needed to address this one remaining task. APMBC has already cleared almost 64,000 explosive items in the area and plans to clear the last remaining area in 2018 when funding is secured. Other specific areas, the Malhazine Complex in the district of Kamubukwane, is still contaminated with ERW, beyond what the national response capacity can address. On request from IND, APMBC has maintained parts of its operational capacity in Mozambique throughout 2017 while exploring funding options to address this one remaining task. APMBC has already cleared almost 40,000 explosive items in the area.
APOPO registered in Colombia as an NGO in 2016 and has since partnered with Campaña Colombiana Contra Minas (CCCM), the only accredited mine action NGO in the country, to provide them with assistance to develop their standard operating procedures, train their demining teams, provide monitoring of their demining operations, and provide animal detection capacity. This capacity building will ensure that the CCCM teams work safely and efficiently, local-release methods so that toil, effort, and funds are not wasted when clearing mined areas. To date, APOPO has trained 12 CCCM technical teams, and more capacity building will be provided throughout 2018. APOPO is working with CCCM to gain government approval for the introduction of the mine detection rats to increase the productivity of the CCCM demining operations.

APOPO also has an agreement with the Colombian navy to conduct a pilot project once the government has approved the MDR. This pilot project will train Navy personnel in the use of the MDR, undertake testing and accreditation, and conduct survey and clearance operations with the Navy. This will provide proof of performance to DAICMA (National Mine Action Authority) that the rats are a credible means of detecting landmines and will facilitate partnerships with other mine action operators in Colombia.

The current pace of landmine clearance in Colombia is extremely slow due to the improvised nature of the mine threat. These homemade landmines are predominately built from plastic and glass bottles filled with explosives and often contain very little metal. Due to the ineffectiveness of metal detectors with these minimum-metal mines in many parts of the country, manual deminers are forced to excavate their way through each mined field, slowly and carefully, digging 15-cm-deep, 1-meter-wide trenches. This average productivity for a manual deminer in Colombia is between 2 and 10 square meters per day.

MDR do not encounter this problem, as they ignore metal and search only for explosive scent. APOPO is therefore seeking to partner with other mine clearance organisations in Colombia to integrate an animal detection capability with their manual deminers that will significantly increase their productivity. The faster return of formerly contaminated land will allow rural communities to generate income and once again live without the fear of these deadly weapons.

The APOPO mine action programme in Colombia is made possible by its partners and donors, Campaña Colombiana Contra Minas and the Dutch Postcode Lottery.

I have been working for the Norwegian People’s Aid (NPA) for 17 years in conventional mine action that uses large scale and demining with metal detectors. The mine detection rats (MDR) are an extremely effective aid to the work. At one task, the MDR found landmine fragments very quickly, which identified the landmine pattern so that an NPA deminer could quickly find, excavate and destroy the landmines. Around the site, the rats also found other dangerous explosive material such as old bullets and mortars. Although finding the landmines is important, what really helps the local people is the speed at which the MDR can check large areas. Often every single inch has to be properly searched, and this is where the MDR came into their own, helping us finish ahead of schedule. Alongside helping people live in safer land, they also create employment and allow people to return to work and live. APOPO has helped me understand the importance of speed in clearing landmines, and with MDR, we are able to clear mined areas much faster than we thought, which in turn, raises the morale of the communities and gives them a much better quality of life. APOPO is my favorite organisation to work with! 

Adao Vincent Baiao, NPA 1st Section Commander, Malele, Angola
Since our beginnings as a research project in Antwerp University in Belgium almost 20 years ago, APOPO has challenged two of the world’s most pressing concerns head on - landmines and tuberculosis (TB). To date, we have achieved modest success against these serious global issues with our scent-detection technology, helping to find and destroy over 100,000 landmines and detecting TB in more than 12,000 patients who otherwise would have missed by local clinics. Nonetheless, we are committed to relentlessly questioning, developing, and refining that technology through multifaceted empirical research at our training center in Morogoro, Tanzania, where we also institute exemplary animal welfare and close monitoring and evaluation of our training methods. Our detection rats are bred, socialized, trained, and assessed here before they are deployed to global operational sites.

In 2016, I arrived at APOPO to help the organization focus on improving its rat detection technology through research and development. To broaden APOPO’s scientific network and expert perspective on the diverse topics addressed by APOPO’s rat detection technology, we installed an R&D advisory committee of respected scientists from around the world representing a diverse range of skills and expertise. APOPO’s scientific team consults with these experts on specific matters ranging from animal scent detection and rodent olfaction to the chemical composition of volatile organic compounds, which the rats smell when detecting target substances.

Throughout 2017, we focused on building a strong research team, comprised of highly skilled students, researchers, and postdoctoral scholars who are conducting various behavioral studies aimed at optimizing detection rat training techniques through a better understanding of the rats themselves, including how they learn about the odors they smell in the world. Our efforts to build APOPO’s R&D branch maintain our productive partnerships with the University of Antwerp, Sokkine University of Agriculture, Western Michigan University, Waikato University, and the Max Planck Institute while broadening our scientific affiliations to include other global research partners.

I was fortunate to spend 10 days at the APOPO training headquarters through my role as a member of the Research and Development Advisory Committee. I was most impressed by the ingenious training methods that are used, and by the commitment to improve these methods through further research. I was also impressed with the high level of concern for the welfare of the rats throughout their lifespan.

HIGHLIGHTS

CURRENT STUDIES

DETECTING WILDLIFE TRAFFICKING

In collaboration with Endangered Wildlife Trust (EWT) of South Africa, we are investigating the potential for detecting wildlife products during the smuggling process, such as coffee beans, textiles, cardboard, etc. Funding for this project is provided by the U.S. Fish and Wildlife Service and the U.S. Fish and Wildlife Trade Challenge Fund.

Discrimination training procedures and odontocent sis of training samples are important for the accuracy of clicker and food reward timing. The rats are trained to scratch at the ground when they smell explosives. This can sometimes be ambiguous or poor challenges, because pausing and scratching at the ground while navigating novel territories is part of the natural behavior of our rats. Additionally, there may be times when it is not desirable for the rat to detect the ground’s surface. For these reasons, APOPO designed a new training paradigm – a micro-switch training device, which allows the rat to directly and unequivocally communicate with a trainer. However, using this device in 2017, thereby establishing its feasibility and potential for further development.

Behavioral changes impact rat’s detection performance. APOPO’s rats are trained to scratch at the ground when they smell explosives. This can sometimes be ambiguous or poor challenges, because pausing and scratching at the ground while navigating novel territories is part of the natural behavior of our rats. Additionally, there may be times when it is not desirable for the rat to detect the ground’s surface. For these reasons, APOPO designed a new training paradigm – a micro-switch training device. However, using this device in 2017, thereby establishing its feasibility and potential for further development.

Training behavior impacts rat’s detection performance. Among APOPO’s greatest assets are our rats and our passion and knowledgeable trainers. Despite their great skill and dedication, we hypothesized that subtle differences in trainer behavior could influence rat performance. Specifically, we wondered how the accuracy of clicker and food reward timing and data collection impacts the rats’ real or perceived detection performance.

To meet these training needs and build internal capacity, our training headquarters also welcomed seven new rodent trainers and 10 additional rats to join the team in Cambodia and readied 16 additional rats to join the Angola team in the new year. A further 10 rats were trained to lead the new TB-detection research project in Addis Ababa, Ethiopia.

In addition to training the 38 young rats described above, our mine-detection rat training team successfully prepared 24 rats to join the team in Cambodia and welcomed 16 additional rats to join the Angola team in the new year. A further 10 rats were trained to lead the new TB-detection research project in Addis Ababa, Ethiopia.

ANNUAL REPORT 2017
What is APOPO’s goal?

Our aspiration is to tackle TB through the deployment of the African giant pouched rat and using its remarkable sense of smell. Looking back on more than a decade of research, the list of results is substantial. Initial research began in 2002, with a successful proof of principle that rats can be trained to detect TB in human sputum samples, and in the following years, the discovery of TB-specific volatile organic compounds (VOCs), which are the source of the scent that rats detect. Since then, APOPO has further developed its scent-detection technology and evaluated the TB-detection rats’ performance and qualities under field conditions. Partnerships began with four clinics of the National TB and Leprosy Program in Tanzania in 2007. By the end of 2017, collaborators had risen to 57 local clinics in Tanzania and 14 in Mozambique, as well as 30 clinics ready to partner on the new research program in Ethiopia. Our field research allowed us to demonstrate the rats’ low cost and high speed of sample evaluation in different settings. Overall our research achieved a marked increase in TB case detection by about 40% compared to case detection at the clinics. Since the research program began, that has amounted to 12,680 additionally detected TB-positive patients (1,677 in year 2017 alone) who otherwise would have received a negative test result. Analyses by age group and HIV status suggest even higher yields among young children and people living with HIV. The latest diagnostic accuracy study (published in November 2017) showed that a team of rats is more sensitive than sputum microscopy when compared to bacterial culture (gold standard). It also indicated that the rats, unlike other tests, are equally successful in correctly identifying TB among people living with HIV and those without. However, the rats’ specificity, which is the ability to correctly rule out the disease, was suboptimal. Thus, further research and development is needed. In 2017 we were given the opportunity to present our results to expert audiences at the Tanzania Health Summit, the African region and World conferences of the International Union Against Tuberculosis and Lung Disease, where our results received significant interest.

Dr. Fiebig joined APOPO in July 2017 as Head of Tuberculosis. She is trained as an infectious disease epidemiologist (Ph.D.) and veterinarian doctor, and she has gained substantial practical experience in TB epidemiology, surveillance, and epidemic control through her work at the Robert Koch Institute, the National Public Health Institute in Germany, and through WHO consultancies and research stays in various African countries. Her special interest lies in improving TB case finding, linkage to care, and prevention of spread through innovative approaches.
QUALITY CONTROL

We use an external quality assurance test (EQA) from the United Kingdom National External Quality Assessment Service for Microbiology (UK NEQAS) three times a year to check our performance in conventional and fluorescence microscopy identification of Mycobacterium tuberculosis. We are given anonymized smear samples to analyze and send back. Our results are graded and returned. This process makes sure that we, too, have high standards by following the same NEQAS procedures. We ensure that our TB detection in children, among whom TB is often difficult to diagnose because the bacterial load is lower and they often cannot produce sputum in the desired quality and quantity. We cannot easily detect Mycobacterium tuberculosis in patients with a low number of TB-causing bacteria in their sputum, which cannot be easily detected by conventional microscopy. That makes our research particularly interesting for TB detection in children, which demands TB detection that is accurate. Our results are usually very good, but this EQA test helps us as a way to make changes where necessary. As a team, we always discuss how we can achieve improvements. It is very important to maintain high standards by following the same NEQAS procedures. That way, the quality of the samples and results is guaranteed. Following the same NEQAS protocol, we always discuss how we can achieve improvements. Other labs in the world follow makes sure that we, too, have high standards by following the same NEQAS procedures. The APOPO TB detection research program in Tanzania collaborates with the TVLA. Main donors of the program include the Carraresi Foundation, Postcode Loterij, the Principality of Liechtenstein, the Swiss Federal Department for Foreign Affairs – Embassy of Switzerland in Dar es Salaam, Tanzania, and the Embassy of the Federal Republic of Germany in Dar es Salaam, Tanzania.

PROGRAM MANAGER TB TANZANIA

DR. GEORGIES MGODE

How can a technology undergoing R&D already make a difference?

Our TB-detection rats are a technology for ‘research use’ only. The rats are known as human epidural drainage systems. They have already been tested for TB using conventional methods in our collaborating health centers. When a rat detects TB in a sample that has previously tested negative, the sample will be rechecked by whom-endorsed confirmatory tests such as LED fluorescence microscopy in our quality-assured labs. Upon agreement with the national TB program and local health authorities in the countries in which we work, our confirmed TB-positive results are conveyed back to the clinicians, who then arrange patient treatment. This is how our research increases the TB case detection.

Case detection - and then?

Detecting the cause of the disease is key to controlling TB. It can only achieve benefits where patients are then treated effectively and reliably cured. To make this possible, we strive for an ‘overnight’ service so that clinics are notified of outcomes before patients return for their standard result the day after their initial visit. We also partner with local community-based organizations who supervise and educate patients, and ensure that patients who tested positive return to official TB clinics to receive care. Over 2017 this model was successfully implemented in APOPO’s new laboratory in Dar es Salaam. Same-day testing and 24-hour result turnaround were achieved, and 81% of patients - markedly more than before the opening of the new central lab - were successfully linked to care. In 2017 APOPO also began to pilot an innovative digital tool, Operation ASHA’s eCompliance, in Dar es Salaam supported by the Human Development Innovation Fund (HDIF). Community health workers from the patient organization MUKIKUTE visit TB patients at home and bring them their medicines. Both patients and health workers document the visit with the digital device. This approach reduces the frequency of the required hospital visit for the patient, and aims to improve treatment adherence rates and ultimately the number of people cured.

Impact 2017

In 2017 the diagnostic activities at the new Dar es Salaam laboratory were fully implemented, and we doubled the number of collaborating TB clinics in Tanzania from 28 to 57, thus achieving wider geographic coverage. Through our field research and diagnostic activities, APOPO successfully produced the city of Dar es Salaam and clinics in the Coast region, Morogoro, and Dodoma, the capital city of Tanzania. The number of presumptive TB patients tested increased to over 30,000 compared to 22,000 in the previous year. Similarly, the percentage of patients in Tanzania who were started on treatment by clinics increased from 71% in 2016 to 81% in 2017. Partnerships with community-based organizations of the MUKIKUTE and PASADA also greatly improved the patient tracking and the treatment of additional patients. The APOPO TB detection research program in Tanzania collaborates with the TVLA. Main donors of the program include the Carraresi Foundation, Postcode Loterij, the Principality of Liechtenstein, the Swiss Federal Department for Foreign Affairs – Embassy of Switzerland in Dar es Salaam, Tanzania, and the Embassy of the Federal Republic of Germany in Dar es Salaam, Tanzania.

Through the increase in collaborating clinics, more people in peripheral areas of Dar es Salaam, Coast region, Morogoro, and Dodoma have access to services through partnerships with the TVLA clinics in peri-urban settings, mostly located more than 100 km from a major hospital. People in these settings may have particular difficulty of accessing good-quality diagnostic services. Detailed analyses of our results stressed that our TB-detection research intervention was especially valuable among TB patients with a low number of TB-causing bacteria in their sputum, which cannot be easily detected by conventional microscopy. That makes our research particularly interesting for TB detection in children, which demands TB detection that is accurate.

Detailed analyses of our results stressed that our TB-detection research intervention was especially valuable among TB patients with a low number of TB-causing bacteria in their sputum, which cannot be easily detected by conventional microscopy. That makes our research particularly interesting for TB detection in children, which demands TB detection that is accurate. Additional patients diagnosed 1,244
The Mozambique APOPO TB program maintains 100% coverage of all microscopy TB-suspect samples processed in the city of Maputo. However, in 2017, Mozambican health authorities started a welcome roll out of the TB detection methodology in the city. The first 12 months implementation of this methodology in the city allowed an overall coverage of all microscopy TB-suspect samples processed in the city. The Mozambique APOPO TB program is funded and partnered by the Government of Flanders, the German Leprosy and Tuberculosis Association (DAHW) and the Skoll Foundation. The program is being implemented in collaboration with the National Tuberculosis Control Program (PNTC), the Instituto Nacional de Saúde (INS), the Maputo City Council Department of Health and the Maputo Health Directorate. Our main operational partner is Kenguelekezé.

To tackle this issue, and following the example of the APOPO Tanzania TB program, a pilot program was conducted between June and November of 2017 in two clinics in collaboration with the Instituto Eduardo Mondlane (IEM), the Mozambique National Tuberculosis Control Program (MECT), the Instituto Nacional de Saúde (INS), the Maputo City Council Department of Health and the Maputo Health Directorate. Our main operational partner is Kenguelekezé.

The enhanced case finding research aims to assess the contribution of the national TB screening program in Ethiopia by increasing the number of identified TB-patients by at least 35% in the short term, and the capability of a local capacity building in Ethiopia. APOPO expects to find about 40% of the active cases that are missed in the national screening program. The enhanced case finding research aims to assess the rats’ contribution and detection ability of the rats for active case finding through mass screening of inmates and prison staff in 35 prisons across Ethiopia. The enhanced case finding research aims to assess the contribution of the national TB screening program in Ethiopia by increasing the number of identified TB-patients by at least 35% in the short term, and the capability of a local capacity building in Ethiopia.

The entire year was dedicated to building the APOPO testing facility in the premises of APOPO, procurement and installation of equipment, staff recruitment and training, importing of trained smear microscopy as confirmation for enhanced case finding among presumptive TB cases attending TB clinics in Addis Ababa, expanding the testing and detection ability of the rats for active case finding through mass screening of inmates and prison staff in 35 prisons across Ethiopia.
The APOPO Foundation, which opened in Switzerland in 2015, aims to support the organization’s overall global activities by strengthening its network and financial resources. The office facilitates direct tax-deductible donations for Swiss donors and aims to further engage its local audiences in support of APOPO’s life-saving activities worldwide. Based in Geneva, at the forefront of international mine action efforts and international health, we pursue a role of liaison with both existing and potential partners and donors in Switzerland, identifying opportunities for joint communication and events to foster long-lasting partnerships, as well as increasing engagement with international players such as the Global Fund, WHO, GICHD, and UNDP.

In 2017, the APOPO Foundation continued to support the global fundraising effort of APOPO in Switzerland and further afield, bringing its total funds raised to over CHF 500,000. The office was notably instrumental in securing funding to ensure continuation of mine action operations in both Angola and Cambodia. The Foundation also intensified its promotion of rat detection technology by taking part in a number of conferences and panels at the invitation of International Schools, the United Nations, and the Swiss Confederation, among others. Dedicated to support the groundbreaking movement of the Sustainable Development Goals (SDG), the Foundation was thrilled to see the mine detection rats featured in the demining section of the “SDG Stories.” This is an interactive platform created by the Perception Change Project (PCP) of the United Nations in Geneva (UNOG) that reinterprets traditional stories through the prism of the SDGs and is dedicated to informing the public around those issues.

In October, the Foundation had the honor to host a 20th-anniversary celebration in Geneva, an inspiring event designed to reflect on APOPO’s 20 years of impact, and we warmly thank the organization’s supporters everywhere.

MARI KURAISHI, CHAIRPERSON, APOPO U.S.

“"At GlobalGiving, I am surrounded by stories of innovative grassroots organizations on a daily basis, but APOPO's detection rats always stood out. I look forward to seeing APOPO's impact and global reach grow as the organization gains traction within the mine action community and innovates into new areas. Live HeroRAT exhibits at zoos will allow us to demonstrate to thousands of potential supporters how quickly the rats detect landmines. We hope this will inspire people to discover innovation in unexpected places. Just like the foun...""

INSPIRING PEOPLE

APOPO SWISS FOUNDATION

The APOPO Foundation, which opened in Switzerland in 2015, aims to support the organization’s overall global activities by strengthening its network and financial resources. The office facilitates direct tax-deductible donations for Swiss donors and aims to further engage its local audiences in support of APOPO’s life-saving activities worldwide. Based in Geneva, at the forefront of international mine action efforts and international health, we pursue a role of liaison with both existing and potential partners and donors in Switzerland, identifying opportunities for joint communication and events to foster long-lasting partnerships, as well as increasing engagement with international players such as the Global Fund, WHO, GICHD, and UNDP.

In October, the Foundation had the honor to host a 20th-anniversary celebration in Geneva, an inspiring event designed to reflect on APOPO’s 20 years of impact, and we warmly thank the organization’s supporters everywhere.

YVES HERVIEU-CAUSSE, CHAIRPERSON, SWISS BOARD

"We were very grateful to see so many people joining us for our 20th-anniversary celebration event centered on our detection rat innovation, its evolution, and our life-saving missions around the world. It was a wonderful opportunity to warmly thank again all our donors, partners, and friends. Your support allows us to make a true difference..."

APOPO U.S. OFFICE

APOPO U.S. aims to support the organization’s overall global activities by strengthening collaboration with U.S.-based non-profit partners. The office facilitates direct tax-deductible donations for the U.S. public, which makes up over 50% of the organization’s global public supporters. Based in Washington, D.C., APOPO U.S. also looks to build partnerships with other U.S.-based global health and public health implementers to scale APOPO’s detection rat technology to impact more communities across the globe.

In 2017, APOPO U.S. played a leadership role in launching an online crowdfund initiative, with donors and individuals giving more than $70,000 to support the organization’s worldwide work. The office also supports the APOPO Columbia River Action Program due to the proximity of the sites and the potential for joint activities. To support the peace process, APOPO U.S. also formed partnerships with U.S.-based organizations and, in 2018, live simulated mine detection rat demonstrations are expected to be a feature of at least one major zoo in the U.S.

In 2017, the APOPO Foundation continued to support the global fundraising effort of APOPO in Switzerland and further afield, bringing its total funds raised to over CHF 500,000. The office was notably instrumental in securing funding to ensure continuation of mine action operations in both Angola and Cambodia. The Foundation also intensified its promotion of rat detection technology by taking part in a number of conferences and panels at the invitation of International Schools, the United Nations, and the Swiss Confederation, among others. In 2017, the long-standing relationship and efforts between APOPO and Sokoine University of Agriculture’s Pest Management Centre led to a milestone we will all remain proud of: We were chosen by the World Bank as an Africa Centre of Excellence for Innovative Rodent Pest Management and Biosensor Technology Development. This centre provides a great opportunity for us to refine biosensor technology and explore possibilities for its application beyond landmine and tuberculosis detection. Most importantly, it provides an opportunity to expand the capacity in terms of a trained human resource across the region and beyond, and consequently to ignite the drive to cascade our technologies to the public domain.

It is one of the four World Bank Centers of Excellence in Tanzania selected through a rigorous and highly competitive exercise that saw 116 project proposals submitted but only 24 chosen to form the African Centers of Excellence II (ACE II) across the East and Southern Africa (ESA) region. ACE I is a similar set of African Centers of Excellence in West Africa. Each of the 24 ACEs will be funded up to U.S. $6 million over the five years of the project.

The objective of the ACE II project is to strengthen selected higher education institutions in Eastern and Southern Africa to deliver quality postgraduate education and build collaboration research capacity in the regional priority areas. These experts will go on to develop and apply science and technology and meet the demand for skills required to solve Africa’s most pressing challenges.

The launch of the Tanzanian Africa Centers of Excellence took place on August 23, 2017, at the Nelson Mandela Institute of Science and Technology in Arusha.

I trust that we will maximally exploit this rare opportunity to achieve even more lucrative milestones for the betterment of our needy and marginalized communities. Thanks to the World Bank for its confidence and trust in us. Rest assured of my support as the Director of Pest Management Centre towards the realization of this endeavor."

"As a humanitarian NGO embracing social transformation and innovation, we are proud to be part of APOPO’s plan to play a proactive role in safeguarding our climate and planet through offsetting its carbon footprint."

Janet Maro, Founder SAT

In April 2016, APOPO partnered with Sustainable Agriculture Tanzania (SAT) to embark on a tree planting project that will help offset APOPO’s CO2 emissions caused by transport and travel. The project aims to plant 50,000 trees over a five-year period, aimed at fostering sustainable agricultural practices that prevent soil productivity and protect the country’s natural forest. Since then, the project has successfully planted 3,282 trees with an additional 11,000 trees planned for the next year.

Sokoine University of Agriculture (SUA) a Centre of Excellence

Types of trees planted: 7
Farmers trained by SAT: 40
Seedlings prepared in 2 nurseries: 4,246
Trees successfully planted: 3,282

"The Centre of Excellence provides an opportunity to expand our capacity in terms of trained human resources across the region and beyond, and consequently to ignite the drive to cascade our technologies to the public domains."
ince the start of the APOPO Cambodia Mine Action program in 2015, the public has shown a strong interest in the use of rats to detect landmines. APOPO capitalized on this by opening a Visitor Centre to highlight our work and raise public awareness about the global issue of landmines.

The Center provides background to APOPO’s work to give our visitors a better understanding of mine action and how landmines affect local communities, and also to introduce and demonstrate the work of the mine detection rats. The MDR provide our supportive national partner The Cambodian Mine Action Center (CMAC) with a unique solution to speeding up demining efforts in the country, helping to detect landmines faster than by using conventional methods such as metal detectors.

APOPO has also been careful to make sure the center is environmentally friendly by supporting the community through employing locally and working with ethical and local suppliers. By the end of the year, the center had already hosted more than 1,000 visitors from all around the world.

Meet our HeroRATs

Shuri is a staff favourite with a cheeky personality who brings a smile to the face of everyone she meets. Just a youngster, she has recently graduated from APOPO mine detection training with flying colors. With a flash of her whiskers, Shuri will help sniff out landmines in Angola, one of the most mine-affected places in the world.

Magawa is one of the friendliest HeroRATs ever, but once he gets to work, he’s as determined as they come. Based in Siem Reap, Cambodia, Magawa sniffs out deadly explosives 96 times faster than conventional solutions can find them.

Chewa is one of the biggest HeroRATs of all time. Weighing in at a monstrous 1.36 kg, Chewa’s weight meant he was always destined to sniff out tuberculosis rather than landmines (just in case he set them off). Chewa (pronounced Cheh-wah) means “brave” in Swahili, but his handlers call him Mchakamka, which means “the hard worker.”

5-star review, Trip Advisor

Chewa (pronounced Cheh-wah) means “brave” in Swahili, but his handlers call him Mchakamka, which means “the hard worker.”

Visitors have been impressed by APOPO’s work, and most are not aware that Cambodia remains one of the most mine-affected countries in the world. On popular online ratings sites, the Visitor Center has achieved a perfect five-star score. We will now work to make the center more accessible to non-English-speaking people, host local events such as photography exhibitions, and develop a section about the APOPO TB-detection rats.

I visited Apopo when it first opened and was blown away! It was so amazing to learn about the incredible work that they have already done and are continuing to do in Cambodia and around the world. It was such a privilege to see the rats in action. They are so well treated and really are heroes! — 5-star review, Trip Advisor

APOPO’s HeroRAT adoption gives you the chance to join one of three HeroRATs on a life-saving adventure. Every adoption comes complete with a 10-page welcome pack, adoption certificate, and monthly impact updates with the latest news, pictures, and statistics from the field. For as little as US $7 a month, you can adopt or gift a HeroRAT and help save lives. And now you can make your adoption extra special by including a printed welcome pack, soft toy, or T-shirt as part of your package as well. Visit our website to find out more!
Thank you to our partners and donors

Over the years, the vital support for APOPO from our donors and partners has never ceased to amaze and humble me. This was brought all the more home to me during 2017, our 20th-birthday year, when I was able to reflect on the significant advances in our work that have been accelerated by your help, enabling far-reaching and sustained impact, supporting the communities where we work.

For almost 20 years, people like you have directly helped us strengthen foundations that upgrade not just the ability of our HeroRATs to detect landmines and tuberculosis but also APOPO’s overall capacity to address these grave global issues. With your continued support in 2017, we built on those foundations by setting foot in two new landmine-contaminated countries, constructing a new TB facility in Ethiopia, and commencing investigations on exciting new areas that address wildlife conservation and carbon offsetting. As well as this, you directly boosted our organizational capability by helping us acquire key staff and operational equipment that have huge potential for helping us to work more efficiently and capitalise on opportunities. Our enhanced marketing activities have already raised the profile of the issues of landmines and global tuberculosis, as well as putting us in a good position to increase our public funding income.

I would personally like to thank each of you for caring about what is happening in the world. So it is with very special thanks that I hope you have read through this report and found out about how you have helped us impact the communities who need it most.

---

**THEORY OF CHANGE**

**DIRECT IMPACT** (organisational capacity)
- Key Staff, Equipment HeroRAT Training
- Research & Development

**DIRECT IMPACT** (operational capacity)
- Clearing Landmines Faster
- Detecting Tuberculosis Faster
- Raised Profile, Quality Sales Products, Increased Fund-Raising
- Improved HeroRAT Performance, Studies Enable New Applications Investigated

**ENABLED IMPACT** (short term)
- More Safe Land Returned to Communities
- Less Fear & Accidents, Land Used for Produce and Development
- People Free From TB, Further Infections Halted
- Back to School and Work, Less Medical Fees, Family Starts Saving, Less Strain on Health Services
- Wildlife and Rescue

**ENABLED IMPACT** (long term)
- Country is Mine Free
- Economy Strengthens and Develops
- TB Cycle Broken
- Long Term Peace and Stability
- Family Prospects Improve
- Infrastructure Rebuild (TB, MA)
- Breadwinners Feed Down (TB, MA)
- Health Services Recover (TB, MA)
- Long Term Part-Partnerships
- Core Funding
- Improved Herorat Performance, Studies Enable New Applications Investigated

**DONOR SUPPORT AND PARTNERSHIPS**
