Surveys to Achieve Quality of Life for Landmine Survivors

Minefields along Tajikistan’s borders with Afghanistan, Uzbekistan and Kyrgyzstan, as well as centrally concentrated civil-war minefields continue to kill and injure Tajik citizens. Through victim-assistance projects, the Tajikistan Mine Action Centre hopes that all landmine survivors can be physically rehabilitated and socially and economically reintegrated into their communities.

by Dr. Reykhan Muminova [Tajikistan Mine Action Centre]

Tajikistan was identified at the First Review Conference of the Anti-Personnel Mine Ban Convention in Nairobi, Kenya as one of 24 States Parties with a significant number of mine survivors and “with the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation and reintegration of survivors. The Tajikistan Mine Action Centre coordinates all mine-action activities within Tajikistan and has a victim-assistance cell, which started functioning in 2006. The VA cell is responsible for assisting the government in the creation of the national strategy to assist landmine survivors, coordinating meetings with all governmental and nongovernmental organizations involved in victim assistance in Tajikistan, updating the names of landmine and unexploded ordnance victims in the Tajikistan landmine database, working with the governmental and nongovernmental organizations, coordinating all VA works in the country, and mobilizing donor support.

In July 2006, the Commission on the Implementation of International Humanitarian Law adopted Tajikistan’s Victim-Assistance Objectives and Plan of Action 2005–2009 and established an inter-ministerial coordination group that discusses VA challenges and tries to coordinate the work of all relevant government ministries, integrating their work into wider government programs.

First Survey. During the research phase of my thesis project at the National Research Institute for Rehabilitation of Persons with Disabilities (2004–2006), in the first survey, I found that landmine survivors rate poorly on any index indicating their quality of life (QoL). There is a high limitation on their physical activity due to amputation of one or more limbs and reduced emotional well-being due to depression, anxiety and physical maladies. Impaired social abilities lead to a lack of nongovernmental enterprises to assist with rehabilitation and workforce reintegration in Tajikistan. All of the aforementioned factors forced survivors, even those with amputations of extremities, to go to Russia to take part in migrant-labor opportunities.

Professional Rehabilitation

TMAC has found that the two most important parts of disabled life are professional rehabilitation (being able to work) and career activity (getting a job). Obstacles to re-entry into the workforce facing landmine survivors in Tajikistan include inflation, unemployment, and a lack of nongovernmental enterprises to assist with rehabilitation and workforce reintegration in Tajikistan. All of the aforementioned factors forced survivors, even those with amputations of extremities, to go to Russia to take part in migrant-labor opportunities.

Rehabilitation is not simply prophylaxis, treatment and outplacement, but a completely new approach to the patient through repeated socialization and reestablishment of personal and social status for the survivor. A job is important as it gives financial support necessary for survival and simultaneously provides a person with a sense of independence, which will lead them to a productive and useful way of life.

Needs assessment. In mid-2006, TMAC developed a VA needs assessment questionnaire in the Tajik language in order to begin surveying landmine survivors. The needs assessment survey finally gained Canada’s support and was implemented in March 2008. All existing data is being analyzed to set priorities for short- and long-term improvement of survivors’ QoL. A detailed report on the mine victims’ survey serves as a tool for making decisions about issues related to their rehabilitation. Based on the needs assessment conducted, TMAC was able to develop a long-term VA strategy and draft and present project proposals to the donors. Landmine survivors identified the need to resume their roles as productive community members and contributors to their families’ well-being.

Obligations of any society to persons with disabilities include providing opportunities for a full life, such as the preservation of their family, participation in society, communication, spiritual development and access to all spheres of life (such as education, health care, social welfare, labor, culture, sports and leisure).

independence. In addition, disabled persons benefit from social contacts and their roles as active members of their families or society. We revealed that VA projects impact not only the survivors, but also their families and all those with whom they interact.

**Income-generating initiatives.** One of Tajikistan’s first projects in the field of mine-victim assistance was the project "Income-generating Initiatives," which started in 2005 within the framework of an agreement between the United Nations Development Programme, which funded the project, and the Red Crescent Society of Tajikistan, which implemented it through TMAC. This project was initiated to "facilitate access to income-generation opportunities" for 72 mine-affected families in six districts, including three districts in Sugd region and three in Rasht Valley. Each of the families was provided with two sheep or goats for breeding and food consumption.\(^3\) The main aim of this project was to reduce the vulnerability to poverty of selected mine survivors and their families. In addition, 21 families are currently involved in an RCST-sponsored beekeeping project in Darvoz district.

In the framework of the individual projects, and thanks to the generosity of people around the world, who donated through a benefit event sponsored by the UNDP and TMAC in November 2006, 11 landmine survivors received assistance in 2007 through the VA program to start small-scale enterprises—five survivors received sewing machines; two survivors each received a musical instrument so they could play at weddings and parties for a modest income; one survivor received beekeeping equipment; and three survivors received shoe-repair equipment. TMAC decided to help these victims in this way because the survivors requested these items at the time of the needs-assessment survey.

Allowing mine/ERW survivors to adopt an income-generating activity enhances their self-esteem, positively affecting everyone around them. The extent and value of this effect was assessed by a professional psychologist. Results revealed that survivors suffered from various borderline psychiatric disorders. Since the assessment, project proposals on psycho-social support have been developed but have not yet been supported by donors.

**Summer Rehabilitation Camp.** Another victim-assistance project, Summer Rehabilitation Camp, is one of the important stages in assisting landmine survivors’ reintegration into society, helping them to cope with psychological problems and adjustment issues. The camp also assists them in regaining and maintaining a healthy and positive outlook on life. For the past three years, a total of 76 landmine survivors (every year about 25 survivors from different age groups) and children from mine victims’ families spend their rest and leisure time in two-week summer camps at the sanatoriums and rest houses situated in the beautiful Romit and Varzob Valley resort areas close to the capital, Dushanbe.

TMAC’s summer camps create an impact on survivors’ general health by bringing together physiotherapy and massage in a bright, friendly, and warm atmosphere. The camp usually supports psychological rehabilitation through individual and group psychological discussions and seminars; art and creative work under the supervision of professional psychologists and artists; movies; and dance. TMAC also provides some cultural stimulation through excursions to the ancient fort at Hisor and to the capital city, Dushanbe. Meetings between the survivors and representatives of the Ministry of Labour and Social Protection of Population of the Republic of Tajikistan and survivors that cover pensions, education and other issues are also held during the summer camp. The survivors find these meetings helpful.

Summer camps enhance communication, promote social contact and increase self-esteem, all of which promote future, sustainable social functioning on the part of landmine survivors and an increase in their QoL. TMAC’s main partners are the Ministry of Labour and Social Protection of the Population of the Republic of Tajikistan, RCST and Harmony in the World, a local NGO.

**Legislation Harmonization**

As the result of the workshop on the Harmonization of Tajik Legislation According to the Implementation of the International Humanitarian Law, and after comprehensive analysis of the existing legislation, experts revealed that the subject matter of existing Tajik
Reykhan Muminova is a psychiatrist; she graduated from the Tajik State Medical University in 1988. Muminova worked as a psychiatrist for the National Research Institute of Rehabilitation of Persons with Disabilities in Dushanbe, Tajikistan, where she started her research devoted to landmine survivors. She is an author of more than 20 scientific articles in different medical journals and research papers published in Tajikistan and abroad. She has worked for TMAC since May 2006 and made significant contributions to its surveys and VA activities.
