The Information Management System for Mine Action in Sudan

**MICHAEL KABIR**

**United Nations Mine Action Programme in Sudan**

**GICHID | CIDHG**

**IMMSA**

The Information Management System for Mine Action in Sudan (IMSMA) has been implemented in Sudan as a modern tool to assist in the management and coordination of mine action operations. IMSMA provides powerful tools to rapidly disseminate information on hazardous areas and other important aspects of mine action by providing digital as well as printed maps and reports.

All U.N. mine-action office and Operations and Quality Assurance Officers in Sudan are equipped with an IMSMA system capable of receiving, analysing and displaying various types of data, including maps, images and information about hazardous areas, mined roads and landmine victims. The system has been in use since 2003 and has been updated regularly with new data and functionalities.

IMSMA in Sudan

The system is currently being used in Sudan for the management of all aspects of mine action, from the operational level to the strategic level. It provides a comprehensive database of mine-affected areas, including data on the number of landmines, unexploded ordnance and other threats.

IMSMA is used in Sudan as an operational tool to facilitate the planning, execution and monitoring of mine action operations. It provides a central database of all mine action activities, allowing for better coordination and communication between different stakeholders.

IMSMA is used in Sudan as a strategic tool to provide insights into the overall situation of mine action in the country. It allows for the development of strategies and policies, as well as the assessment of the impact of mine action operations.

IMSMA is used in Sudan as a training tool to educate and raise awareness about the impact of landmines and unexploded ordnance. The system is used in various training sessions for mine action personnel, including those of the United Nations Mine Action Centre, South Lebanon, and the United Nations Mine Action Support Group.

IMSMA is used in Sudan as a communication tool to disseminate information about mine action activities to the public. The system is used to produce maps, reports and other materials for distribution to the public and other stakeholders.

In conclusion, IMSMA is an essential tool for the effective management and coordination of mine action operations in Sudan. It provides a comprehensive database of mine-affected areas, allows for better coordination and communication between different stakeholders, and provides a platform for the dissemination of information to the public.
