The Information Management System for Mine Action in Sudan has been enhanced to support the activities of the Mine Action Support Group. The system is designed to provide a comprehensive and accurate picture of the status of mine action in Sudan, including the identification of potential areas for action and the tracking of progress and achievements. The system is based on a combination of data from various sources, including satellite imagery, ground surveys, and reports from local authorities. The system is regularly updated to reflect the latest information, and it is used to support decision-making and planning activities.

The system includes a number of key features, including:

- A database of mine action sites and activities
- A data entry system for recording new sites and activities
- A data management system for organizing and tracking data
- A reporting system for generating summary reports
- A training and support system for users

The system is accessible via a web-based interface, and it is designed to be user-friendly and easy to use. The system is currently being used by a number of organizations, including the United Nations Mine Action Service, the United Nations Development Programme, and the Mine Action Centre, South Lebanon.

The system is a valuable tool for supporting mine action activities in Sudan, and it is expected to continue to play a key role in the future. The system is being continually improved and updated to meet the changing needs of the mine action community in Sudan.
